Dirac's forms of relativistic dynamics [Dirac, Rev. Mod. Phys. **21**, 392 1949]

Instant form is the well-known form of dynamics starting with $x^0 = t = 0$

$K^i = M^{0i}$, $J^i = \frac{1}{2} \epsilon^{ijk} M^{jk}$, $\epsilon^{ijk} = (+1, -1, 0)$ for (cyclic, anti-cyclic, repeated) indeces

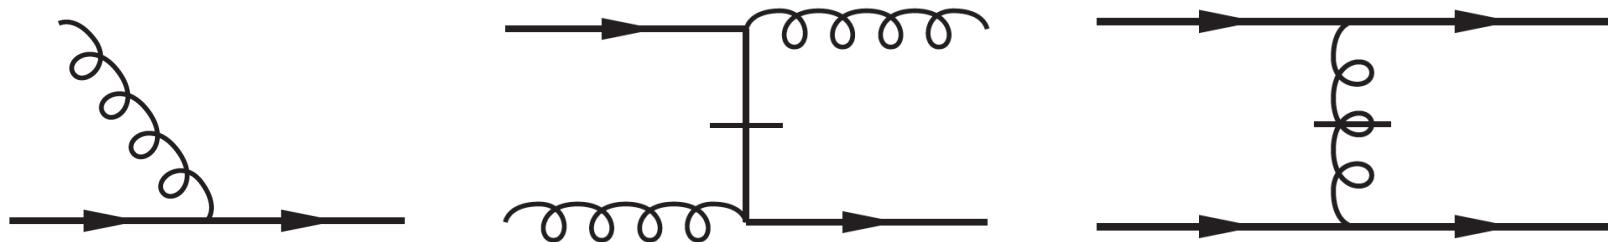

Front form defines relativistic dynamics on the light front (LF): $x^+ = x^0 + x^3 = t + z = 0$

$$P^\pm \triangleq P^0 \pm P^3, \vec{P}^\perp \triangleq (P^1, P^2), x^\pm \triangleq x^0 \pm x^3, \vec{x}^\perp \triangleq (x^1, x^2), E^i = M^{+i}, \\ E^+ = M^{+-}, F^i = M^{-i}$$

	instant form	front form	point form
time variable	$t = x^0$	$x^+ \triangleq x^0 + x^3$	$\tau \triangleq \sqrt{t^2 - \vec{x}^2 - a^2}$
quantization surface			
Hamiltonian	$H = P^0$	$P^- \triangleq P^0 - P^3$	P^μ
kinematical	\vec{P}, \vec{J}	$\vec{P}^\perp, P^+, \vec{E}^\perp, E^+, J^-$	\vec{J}, \vec{K}
dynamical	\vec{K}, P^0	\vec{F}^\perp, P^-	\vec{P}, P^0
dispersion relation	$p^0 = \sqrt{\vec{p}^2 + m^2}$	$p^- = (\vec{p}_\perp^2 + m^2)/p^+$	$p^\mu = mv^\mu \ (v^2 = 1)$

Light Front (LF) Hamiltonian Defined by its Elementary Vertices in LF Gauge

QED & QCD

QCD

Discretized Light Cone Quantization

[H.C. Pauli & S.J. Brodsky, PRD32 (1985)]

Basis Light Front Quantization

[J.P. Vary, et al., PRC81 (2010)]

$$\phi(\vec{k}_\perp, x) = \sum_{\alpha} \left[f_{\alpha}(\vec{k}_\perp, x) a_{\alpha} + f_{\alpha}^*(\vec{k}_\perp, x) a_{\alpha}^\dagger \right]$$

where $\{a_{\alpha}\}$ satisfy usual (anti-) commutation rules.

Furthermore, $f_{\alpha}(\vec{x})$ are arbitrary except for conditions:

Orthonormal: $\int f_{\alpha}(\vec{k}_\perp, x) f_{\alpha'}^*(\vec{k}_\perp, x) \frac{d^2 k_\perp dx}{(2\pi)^3 2x(1-x)} = \delta_{\alpha\alpha'}$

Complete: $\sum_{\alpha} f_{\alpha}(\vec{k}_\perp, x) f_{\alpha}^*(\vec{k}'_\perp, x') = 16\pi^3 \sqrt{x(1-x)} \delta^2(\vec{k}_\perp - \vec{k}'_\perp) \delta(x - x')$

For mesons we adopt (later extended to baryons): [Y. Li, et al., PLB758 (2016)]

$$f_{\alpha=\{nml\}}(\vec{k}_\perp, x) = \phi_{nm}\left(\vec{k}_\perp / \sqrt{x(1-x)}\right) \chi_l(x)$$

ϕ_{nm} 2D-HO functions as in AdS/QCD

χ_l Jacobi polynomials times $x^a(1-x)^b$

BLFQ

Symmetries & Constraints

Baryon number

$$\sum_i b_i = B$$

All $J \geq J_z$ states
in one calculation

Charge

$$\sum_i q_i = Q$$

Angular momentum projection (M-scheme)

$$\sum_i (m_i + s_i) = J_z$$

Longitudinal momentum (Bjorken sum rule)

$$\sum_i x_i = \sum_i \frac{k_i}{K} = 1$$

Finite basis
regulators

Longitudinal mode regulator (Jacobi)

$$\sum_i l_i \leq L$$

Transverse mode regulator (2D HO)

$$\sum_i (2n_i + |m_i| + 1) \leq N_{\max}$$

"Internal coordinates" $\vec{k}_{i\perp} = \vec{p}_{i\perp} - x_i \vec{P}_\perp \Rightarrow$

$$\sum_i \vec{k}_{i\perp} = 0$$

$$H \rightarrow H + \lambda H_{CM}$$

Global Color Singlets (QCD)

Light Front Gauge

Optional Fock-Space Truncation

Preserve transverse
boost invariance

Light-Front Wavefunctions (LFWFs)

$$|\psi_h(P, j, \lambda)\rangle = \sum_n \int [d\mu_n] \psi_{n/h}(\{\vec{k}_{i\perp}, x_i, \lambda_i\}_n) |\{\vec{p}_{i\perp}, p_i^+, \lambda_i\}_n\rangle$$

LFWFs are *frame-independent* (boost invariant) and depend only on the relative variables: $x_i \equiv p_i^+/P^+$, $\vec{k}_{i\perp} \equiv \vec{p}_{i\perp} - x_i \vec{P}_{\perp}$

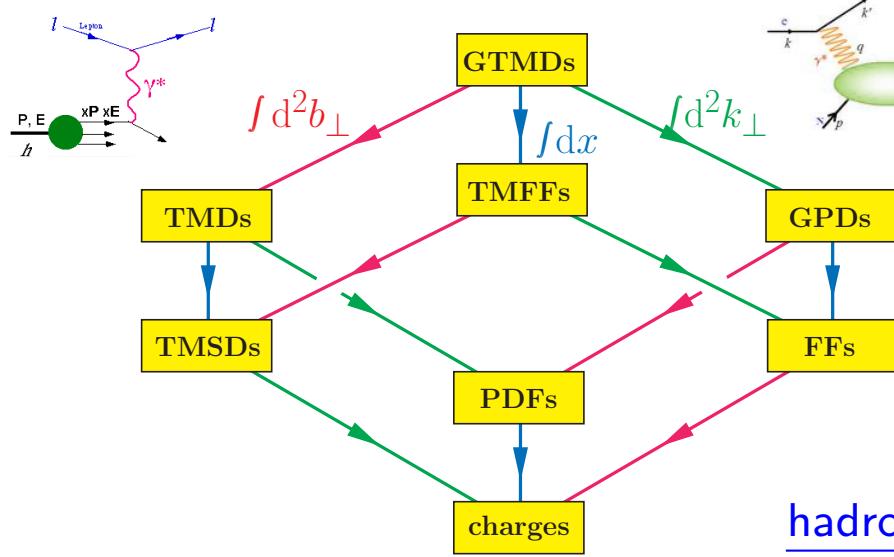

LFWFs provide intrinsic information of the structure of hadrons, and are indispensable for exclusive processes in DIS

[Lepage '80]

- ▶ Overlap of LFWFs: structure functions (e.g. PDFs), form factors, ...
- ▶ Integrating out LFWFs: light-cone distributions (e.g. DAs)

"Hadron Physics without LFWFs is like Biology without DNA!"

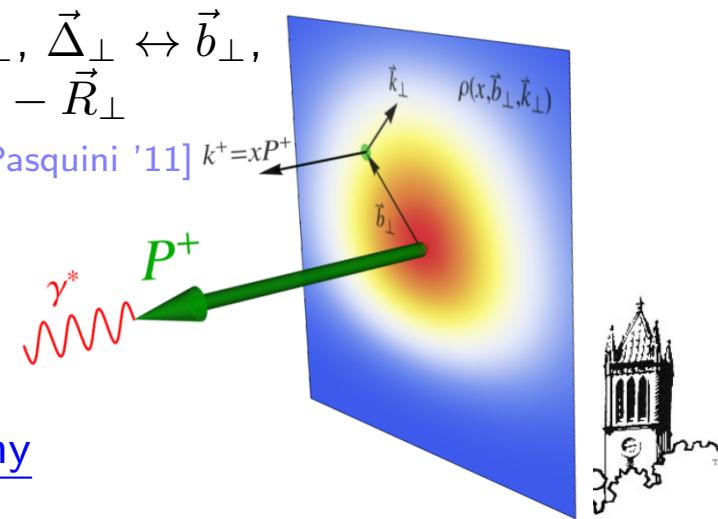

— Stanley J. Brodsky

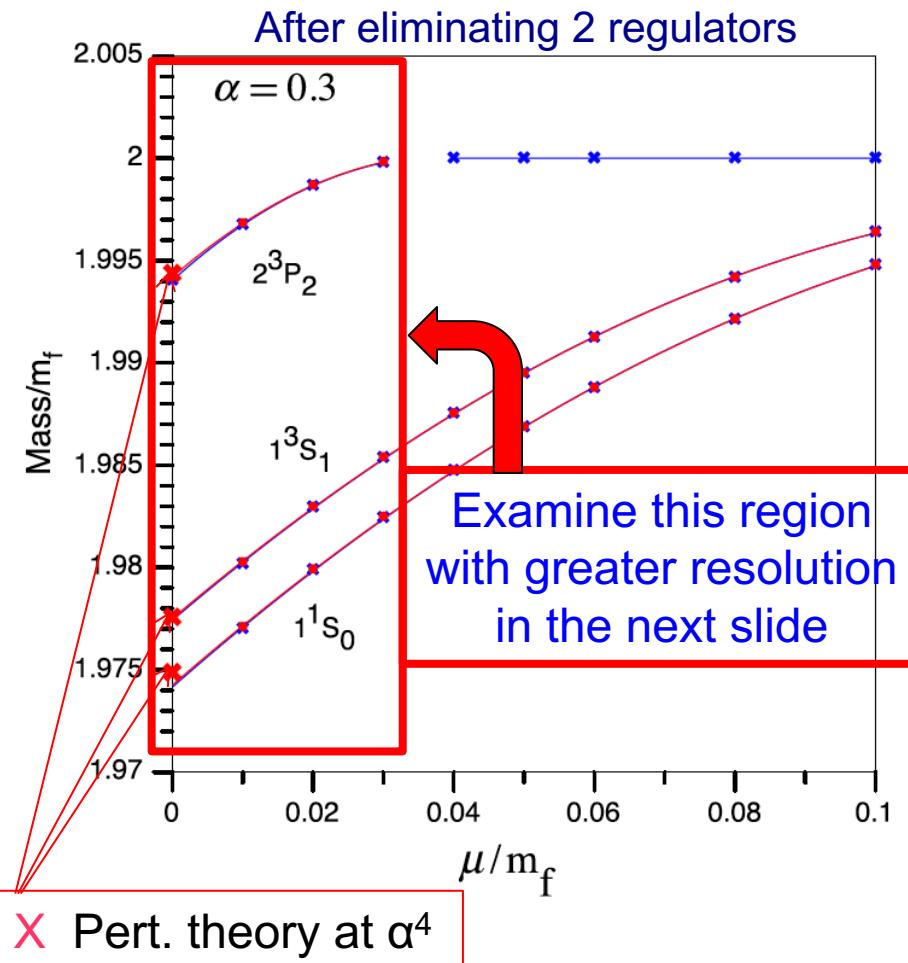

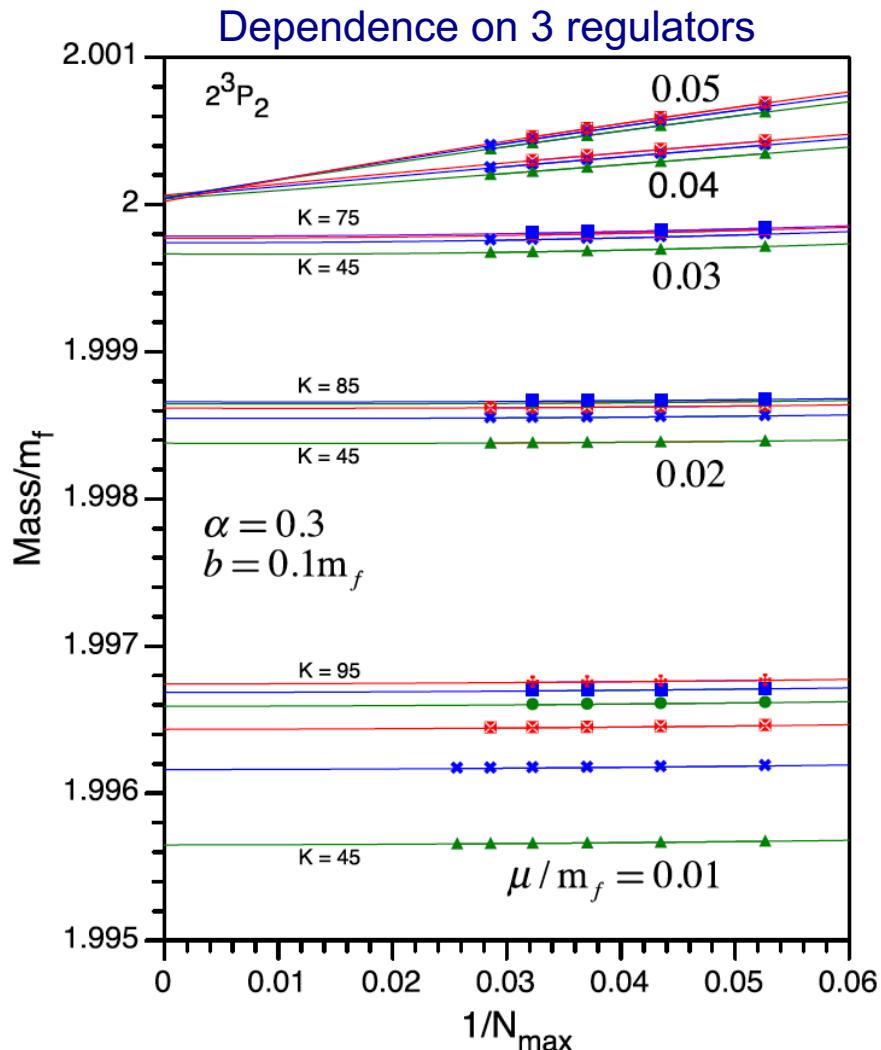

$$\begin{aligned} \vec{k}_\perp &\leftrightarrow \vec{r}_\perp, \vec{\Delta}_\perp \leftrightarrow \vec{b}_\perp, \\ \vec{b}_\perp &= \vec{r}_\perp - \vec{R}_\perp \end{aligned}$$

[Lorcé & Pasquini '11]

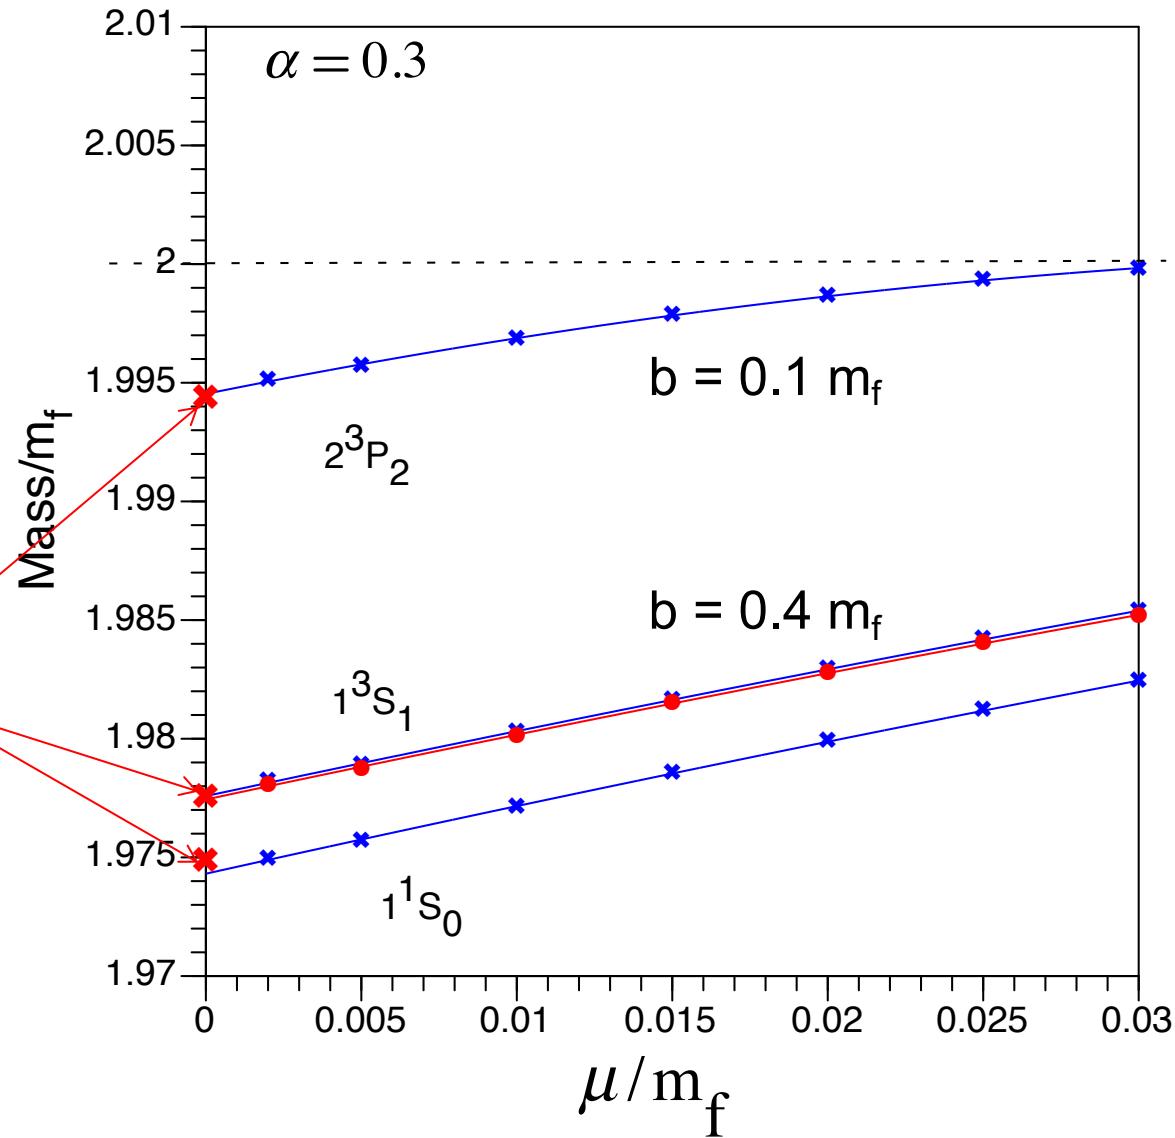

hadron tomography

Basis Light-Front Quantization (BLFQ)
 Positronium in QED at Strong Coupling ($\alpha = 0.3$)
 Systematic removal of regulators ($b = \text{HO momentum scale}$)

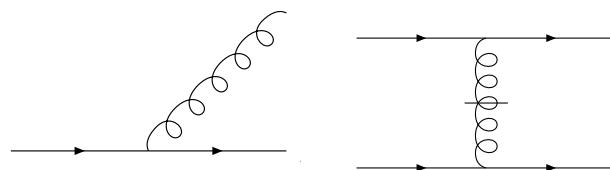

Positronium in QED at Strong Coupling Covariant Basis Light-Front Quantization (BLFQ)

Positronium with one dynamical photon: Light-front QED Hamiltonian

- QED Lagrangian $\mathcal{L} = -\frac{1}{4}F_{\mu\nu}F^{\mu\nu} + \bar{\Psi}(i\gamma^\mu D_\mu - m_e)\Psi$
 - Light-front QED Hamiltonian from standard Legendre transformation

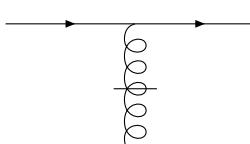

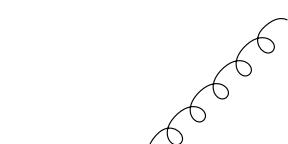

$$\begin{aligned}
P^- &= \int d^2x^\perp dx^- F^{\mu+} \partial_+ A_\mu + i\bar{\Psi} \gamma^+ \partial_+ \Psi - \mathcal{L} && \text{Light-cone gauge: } (A^+ = 0) \\
&= \int d^2x^\perp dx^- \frac{1}{2} \bar{\Psi} \gamma^+ \frac{m_e^2 + (i\partial^\perp)^2}{i\partial^+} \Psi + \frac{1}{2} A^j (i\partial^\perp)^2 A^j \\
&\quad \overbrace{\qquad\qquad\qquad}^{\text{kinetic energy terms}} \\
&\quad + ej^\mu A_\mu + \frac{e^2}{2} j^+ \frac{1}{(i\partial^+)^2} j^+ \\
&\quad \overbrace{\qquad\qquad\qquad}^{\text{vertex interaction}} \quad \overbrace{\qquad\qquad\qquad}^{\text{instantaneous photon interaction}}
\end{aligned}$$

Positronium with one dynamical photon: Interaction Part Of Hamiltonian

$$|\text{Ps}\rangle = a|e\bar{e}\rangle + b|e\bar{e}\gamma\rangle + c|\gamma\rangle + d|e\bar{e}e\bar{e}\rangle + \dots$$

$$\alpha = \frac{e^2}{4\pi} = \frac{1}{137}$$

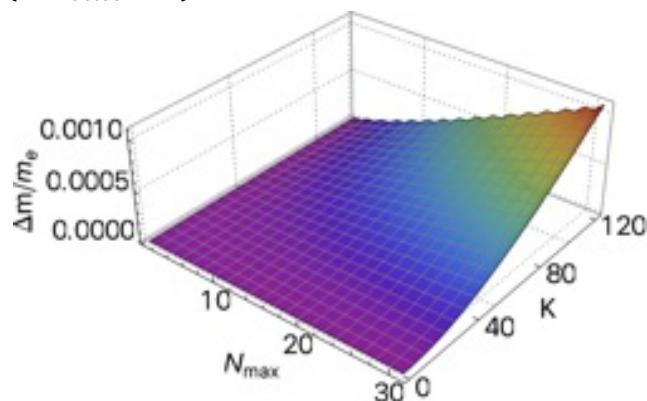

H_{int}	$ e\bar{e}\rangle$	$ e\bar{e}\gamma\rangle$
$\langle e\bar{e} $		
$\langle e\bar{e}\gamma $		0 excluded by <i>gauge principle</i> [Tang et al, 1991]

Mass Renormalization

- Mass counterterm $\Delta_m = m_{bare} - m_{phys}$ is needed for fermion self-energy correction
- Mass renormalization needs to be performed on **single physical electron**
 - Prediction power on positronium mass
- Mass counterterm is determined by fitting single electron mass
 - **Complication:** Δ_m depends on UV cutoff and thus is **basis dependent**.
 - An extension of sector-dependent renormalization is [Karmanov et al, 2008] needed: $\Delta_m(N_{max}, K)$

Here at $\alpha = 1/137$

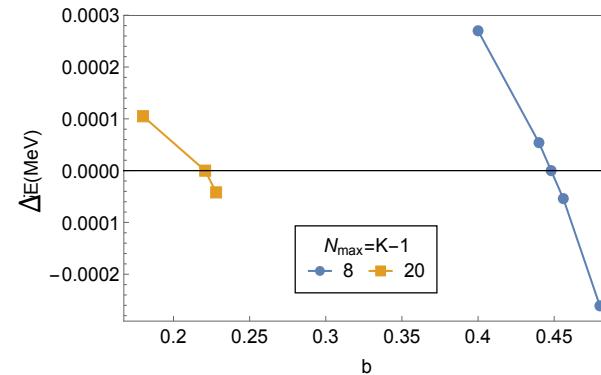

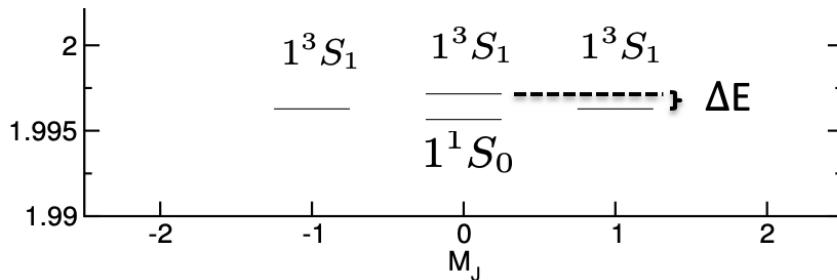

[Kaiyu Fu et al, in preparation]

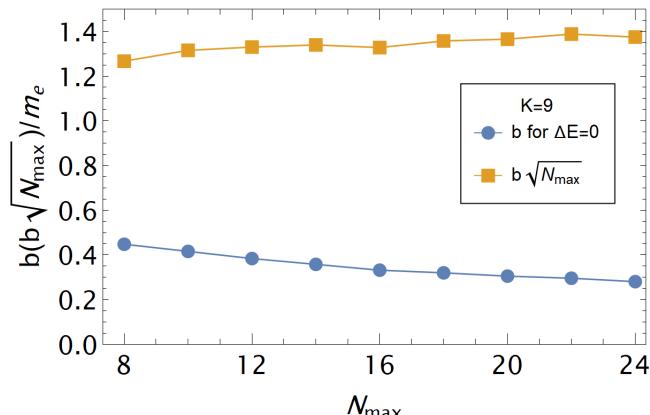

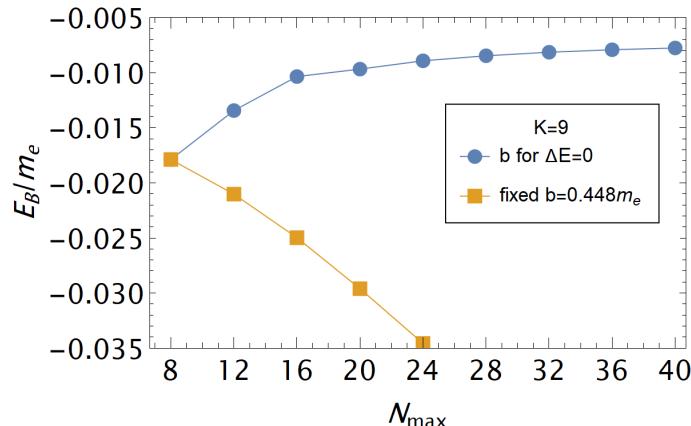

- Mass counterterm is at higher order: $\Delta_m \propto \alpha m E_B \propto \alpha^2 m$

Basis Scale and Rotational Symmetry

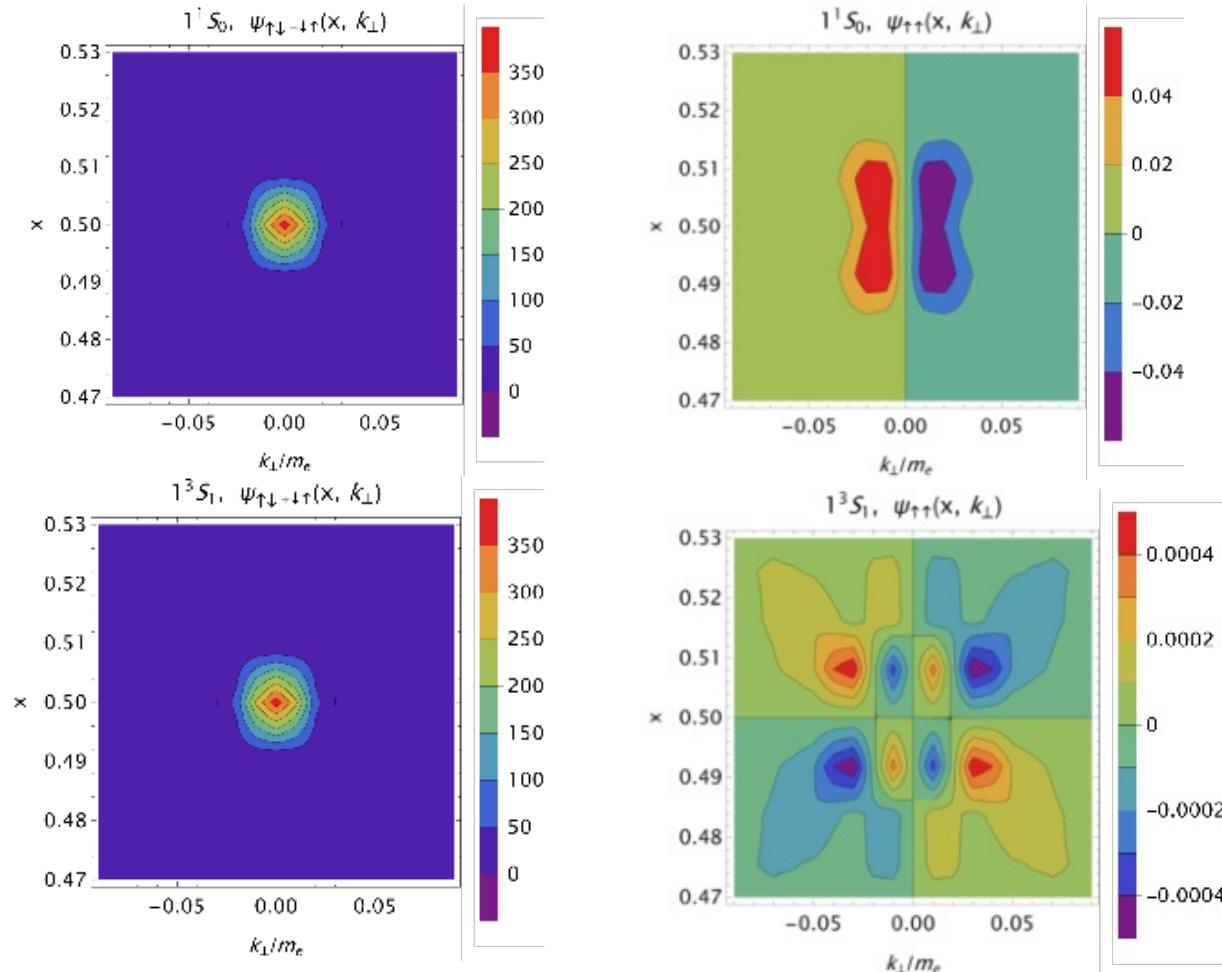

- Adjust the 2d harmonic oscillator basis scale parameter b to minimize the energy difference within the triplet 1^3S_1

- Maintaining rotational symmetry leads to a corresponding UV cutoff

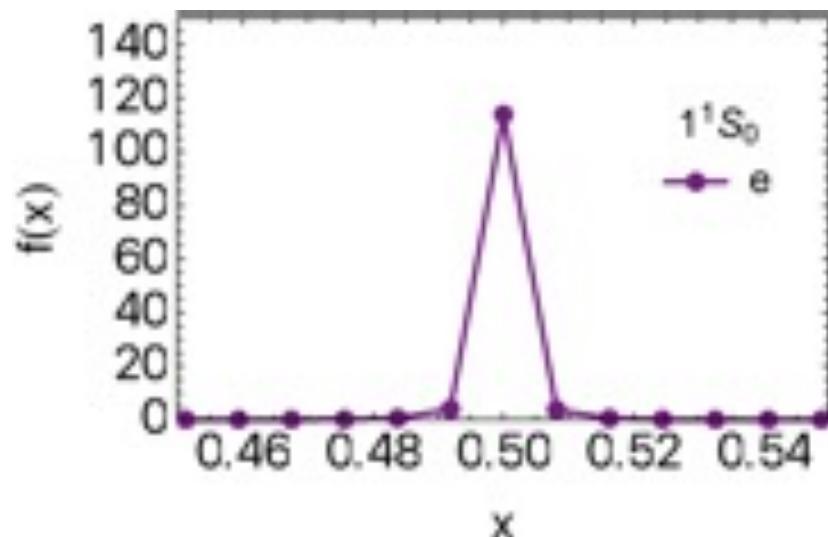

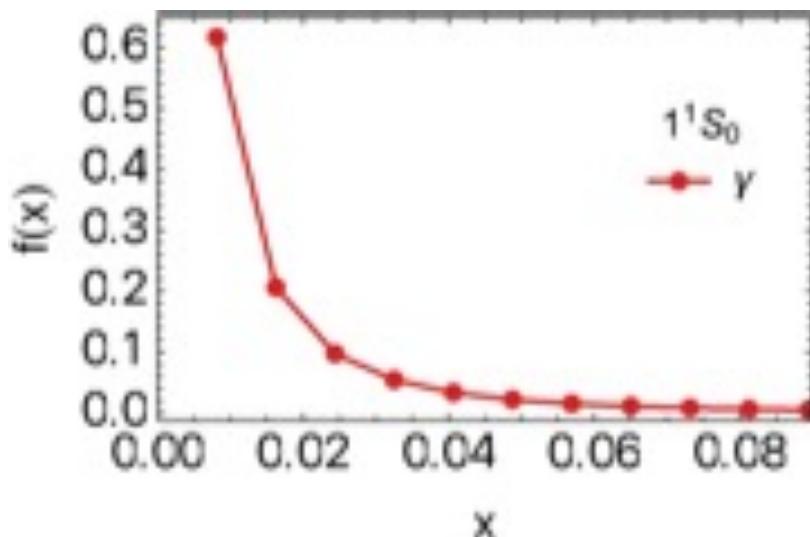

Wave Functions for S-Wave States

- Wave functions in $|e^+e^- \rangle$ Fock sector, dominant and non-dominant helicity component
- Nodal structure visible in non-dominant helicity component

PDFs of the electron and photon

- $|e^+e^- \rangle$ Fock sector carries 99.1% probability.
- The peak of photon PDF is at small x region.

Overview of BLFQ/tBLFQ applications to mesons and baryons

Common features

Transverse confinement from 2D HO (in common with LF Holography)
Longitudinal confinement (Y. Li, et al, PLB 2016, PRD 2017)
Basis states from exact solutions of this reference Hamiltonian
Compare results with experiment, lattice, DSE/BSE, . . .

Distinct features

For V_{eff}

- 1) perturbative one-gluon exchange (Y. Li, et al, PLB 2016, PRD 2017)
- 2) NJL model for light meson applications (S. Jia, et al, PRC 2019)

For Fock space truncation

- 1) Valence sector
- 2) Valence sector plus dynamical gluon (plus sea quarks, plus ...)

For observables

- 1) Single state properties and decays
- 2) Transitions between states
- 3) Non-perturbative probes (tBLFQ)

(Work by Meijian Li, et al)

Next Methods

BLFQ on Quantum Computers

(Work by Wenyang Qian, et al)

Heavy Quarkonia [Y.Li,PLB758,2016; PRD96,2017]

- Effective Hamiltonian in the $q\bar{q}$ sector

$$H_{\text{eff}} = \underbrace{\frac{\vec{k}_\perp^2 + m_q^2}{x} + \frac{\vec{k}_\perp^2 + m_{\bar{q}}^2}{1-x}}_{\text{LF kinetic energy}} + \underbrace{\kappa^4 x(1-x)\vec{r}_\perp^2 - \frac{\kappa^4}{(m_q + m_{\bar{q}})^2} \frac{\partial}{\partial x} \left(x(1-x) \frac{\partial}{\partial x} \right)}_{\text{confinement}} + \underbrace{V_g}_{\text{one-gluon exchange}}$$

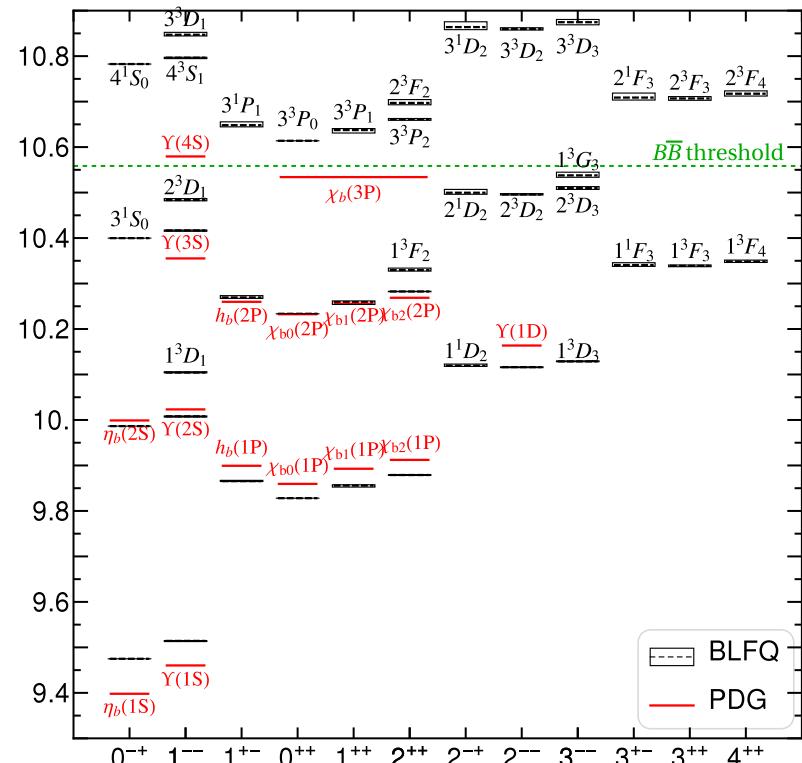

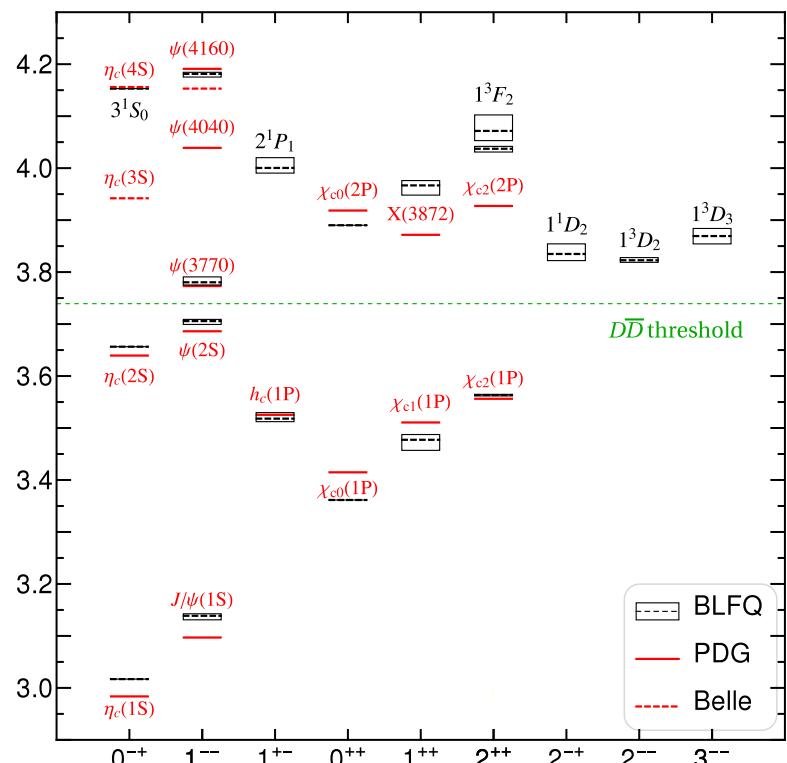

where $x = p_q^+ / P^+$, $\vec{k}_\perp = \vec{k}_{q\perp} = \vec{p}_{q\perp} - x\vec{P}_\perp = -\vec{k}_{\bar{q}\perp} = -(\vec{p}_{\bar{q}\perp} - (1-x)\vec{P}_\perp)$, $\vec{r}_\perp = \vec{r}_{q\perp} - \vec{r}_{\bar{q}\perp}$.

- Confinement
 - transverse holographic confinement [S.J.Brodsky,PR584,2015]
 - longitudinal confinement [Y.Li,PLB758,2016]
- One-gluon exchange with running coupling

$$V_g = -\frac{4}{3} \frac{4\pi\alpha_s(Q^2)}{Q^2} \bar{u}_{\sigma'} \gamma^\mu u_\sigma \bar{v}_s \gamma_\mu v_{s'}$$
- Basis representation
 - valence Fock sector: $|q\bar{q}\rangle$
 - basis functions: eigenfunctions of H_0 (LF kinetic energy+confinement)

Spectroscopy

[Y. Li, et al., Phys. Letts. B 758, 118 (2016); Phys. Rev. D 96, 016022 (2017)]

	κ (GeV)	m_q (GeV)	rms (MeV)	$\overline{\delta_J M}$ (MeV)	N_{\max}	basis dim.
$c\bar{c}$	0.966	1.603	31	17	32	1812
$b\bar{b}$	1.389	4.902	38	8	32	1812

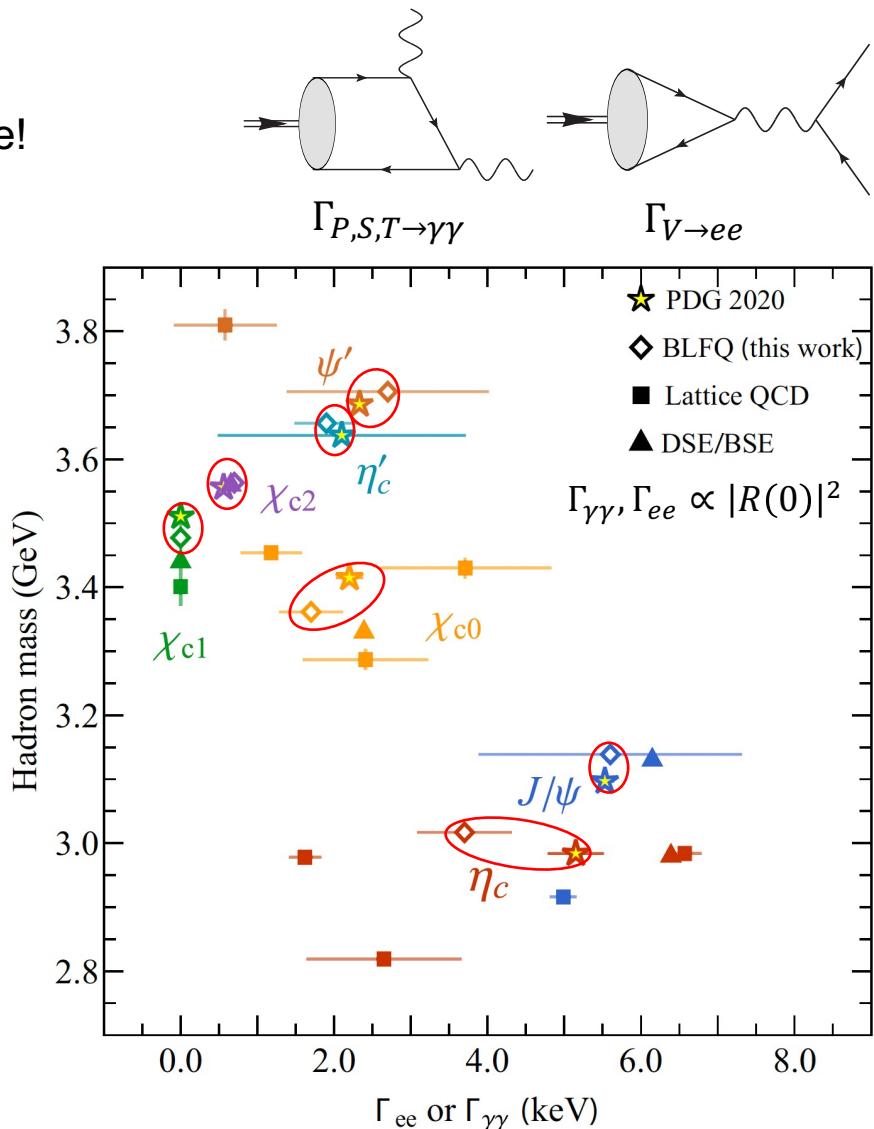

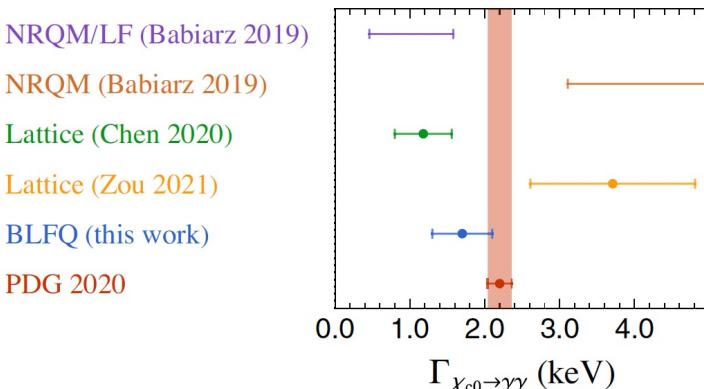

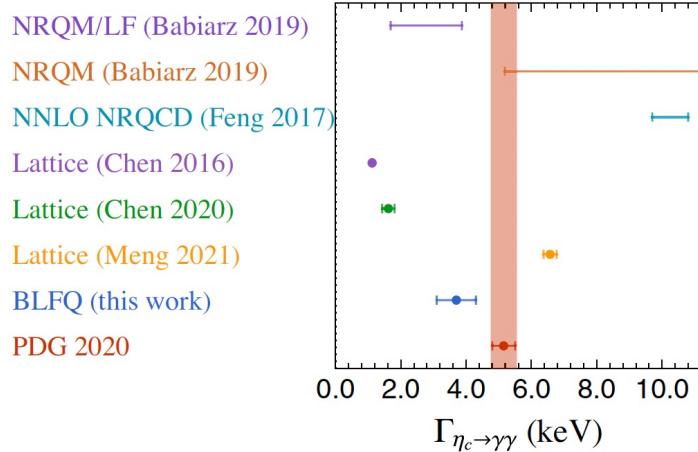

κ determined from fits to spectrum follows the HQET trajectory $\kappa_h \propto \sqrt{M_h}$, in agreement with recent LFH result

[Dosch et al, PRD95 (2017)]

Diphoton width $\Gamma_{\gamma\gamma}$ of charmonia in BLFQ

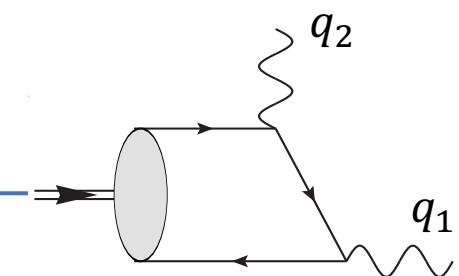

- ✓ Notoriously challenging
- ✓ BLFQ predictions are very competitive!
 - ✓ No parameters were adjusted!

Lattice: Dudek '06, Chen '16, Chen '20, Meng '21, Zou '21;
 NRQCD: Feng '15 & '17
 NRQM: Babiarz '19 & '20

Comparison of theoretical prediction of masses and dilepton/diphoton widths combined

Transition form factor: η_c

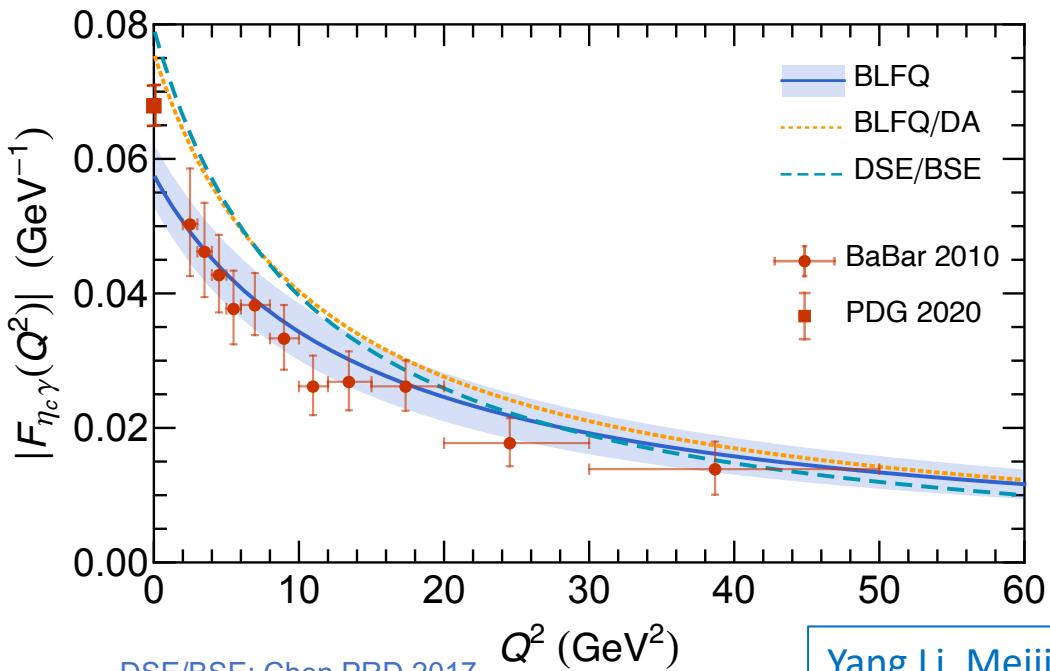

$$\mathcal{M}^{\mu\nu} = 4\pi\alpha_{em}\epsilon^{\mu\nu\rho\sigma}q_{1\rho}q_{2\sigma}F_{P\gamma\gamma}(q_1^2, q_2^2)$$

- ✓ Diphoton width $\Gamma_{\gamma\gamma} = \frac{\pi}{4}\alpha_{em}^2 M_P^3 |F_{P\gamma\gamma}(0,0)|^2$
- ✓ Single-tag TFF $F_{P\gamma}(Q^2) = F_{P\gamma\gamma}(Q^2, 0) = F_{P\gamma\gamma}(0, Q^2)$

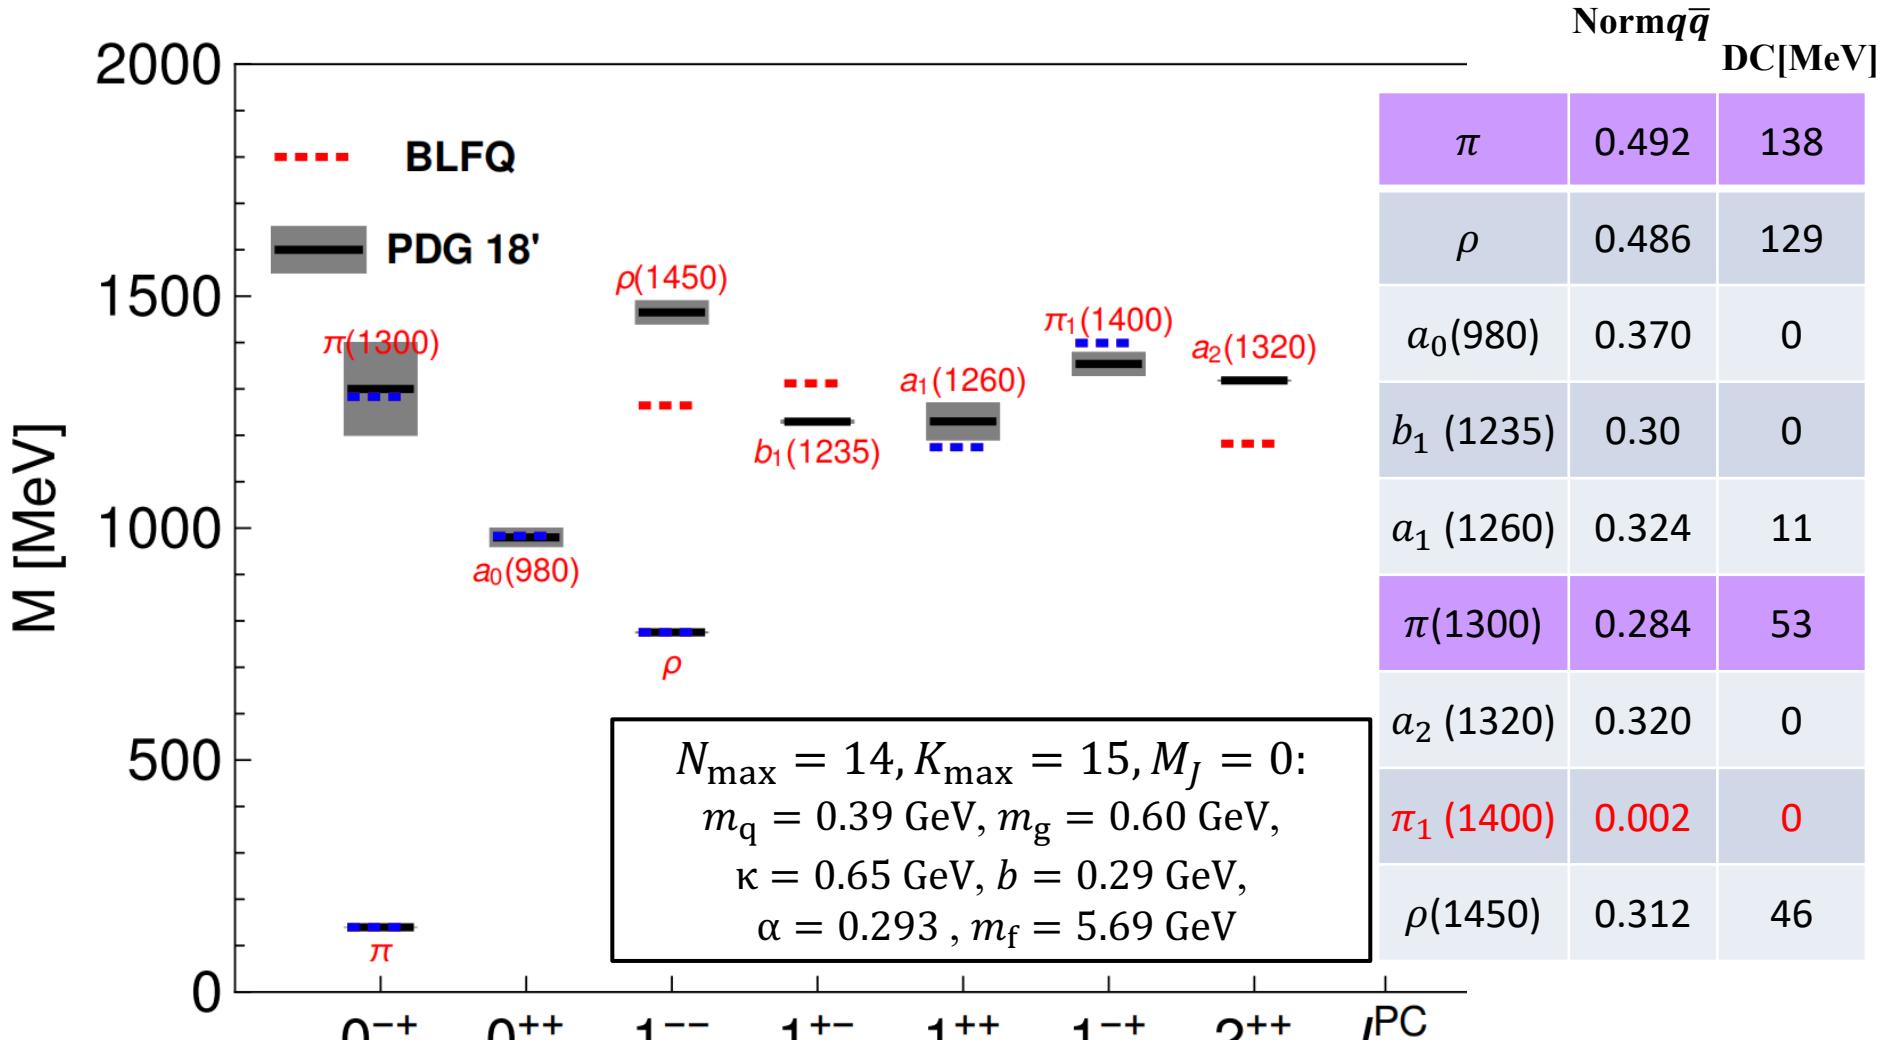

$$F_{P\gamma}(Q^2) = e_f^2 2\sqrt{2N_c} \int \frac{dx}{2\sqrt{x(1-x)}} \int \frac{d^2 k_\perp}{(2\pi)^3} \frac{\psi_{\uparrow\downarrow-\downarrow\uparrow}(x, \vec{k}_\perp)}{k_\perp^2 + m_f^2 + x(1-x)Q^2}$$

Lepage '80, Feldman '97, Babiarz, '19

- BABAR data: described by monopole form with pole mass $\Lambda^2 = 8.5 \pm 0.6 \pm 0.7$ GeV 2 , and width 5.12 (53) keV
- BLFQ: using $N_{\max}=8$ wave function corresponding to $\mu \approx 2m_c$. Basis sensitivity band is taken as the difference between the $N_{\max}=8, 16$ results.
- BLFQ/DA: prediction using the LCDA obtained from the LFWF
- Theoretical prediction in good agreement with both the width and the form factor.

Light Meson Mass Spectrum Including One Dynamical Gluon

$$|\text{meson}\rangle = a|q\bar{q}\rangle + b|q\bar{q}g\rangle + \dots$$

Fix the parameters by fitting six blue states

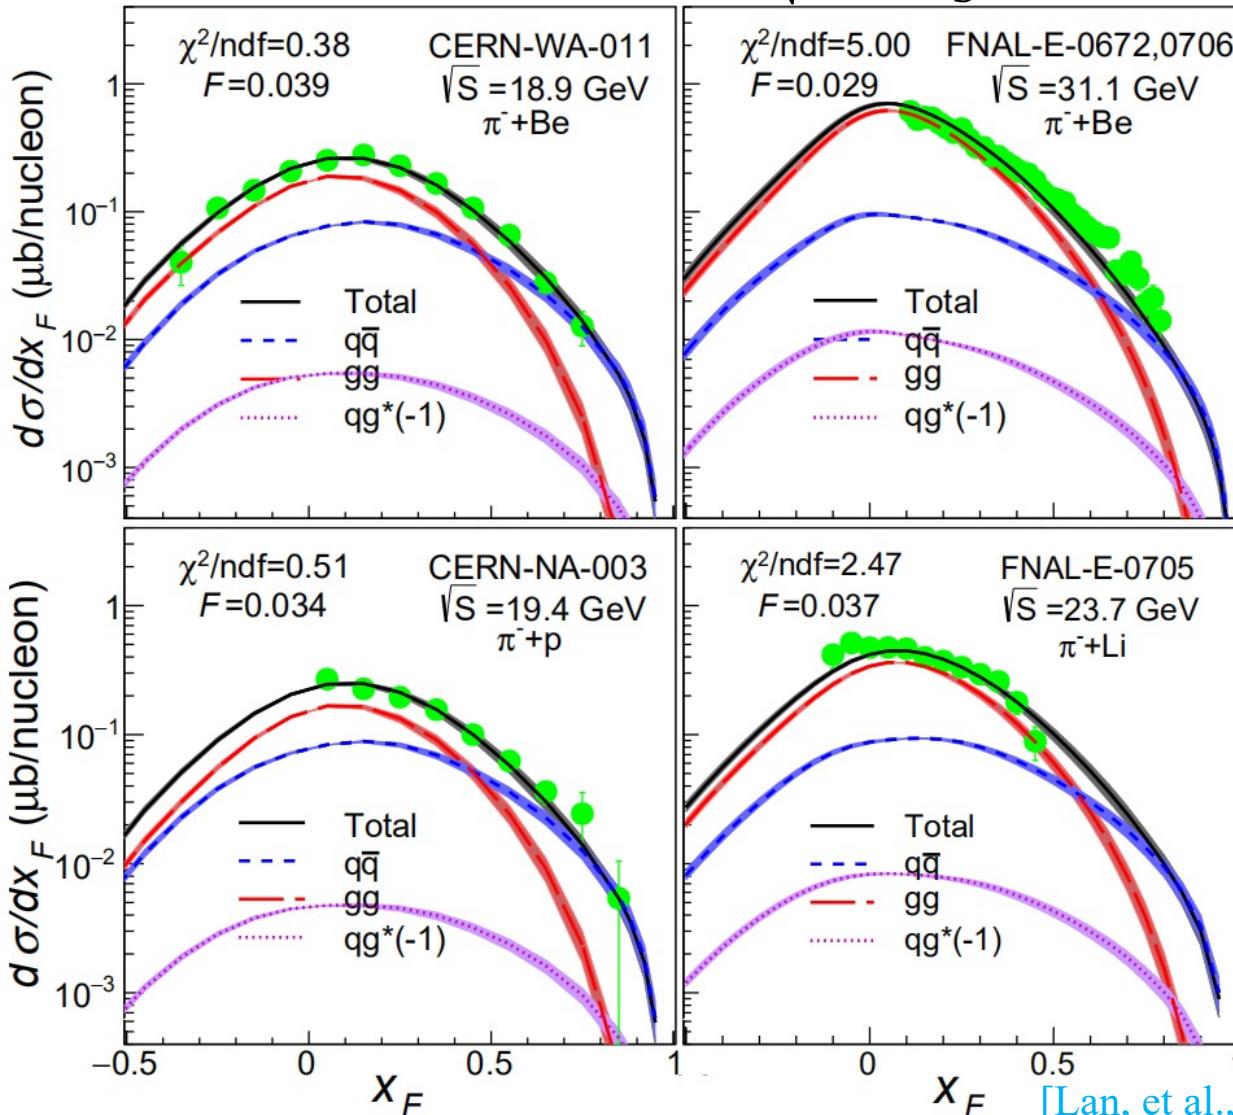

- $\pi_1(1400)$: $|q\bar{q}g\rangle$ dominates
- $\pi(1300)$: Decay Constant (DC) < π 's DC

J/ψ production cross section

$\pi^\pm N \rightarrow J/\psi X$

$$\frac{d\sigma}{dx_F} [J/\psi] = F \sum_{i,j=q,\bar{q},g} \int_{2m_c}^{2m_D} dM_{c\bar{c}} \frac{2M_{c\bar{c}}}{S \sqrt{x_F^2 + \frac{4M_{c\bar{c}}^2}{S}}} \hat{\sigma}_{ij}(s, m_c^2, \mu_R^2, \mu_F^2) f_i^{\pi^\pm}(x_1, \mu_F^2) f_j^N(x_2, \mu_F^2)$$

[nCTEQ 2015]

CEM

[Chang, et al, PRD 102 (2020) 054024];
 [Nason, et al, NPB 303 (1988) 607];
 [Mangano, et al, NPB 405 (1993) 507]

Agree with experimental data (FNAL E672, E706, E705, CERN NA3, WA11).

[Lan, et al., PLB 825, 136890 (2022)]

BLFQ Basis States

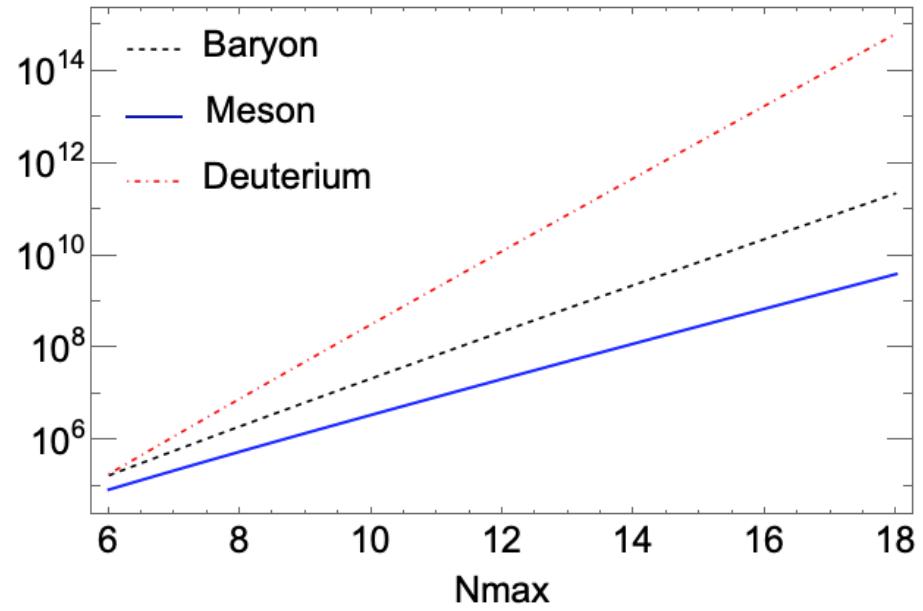

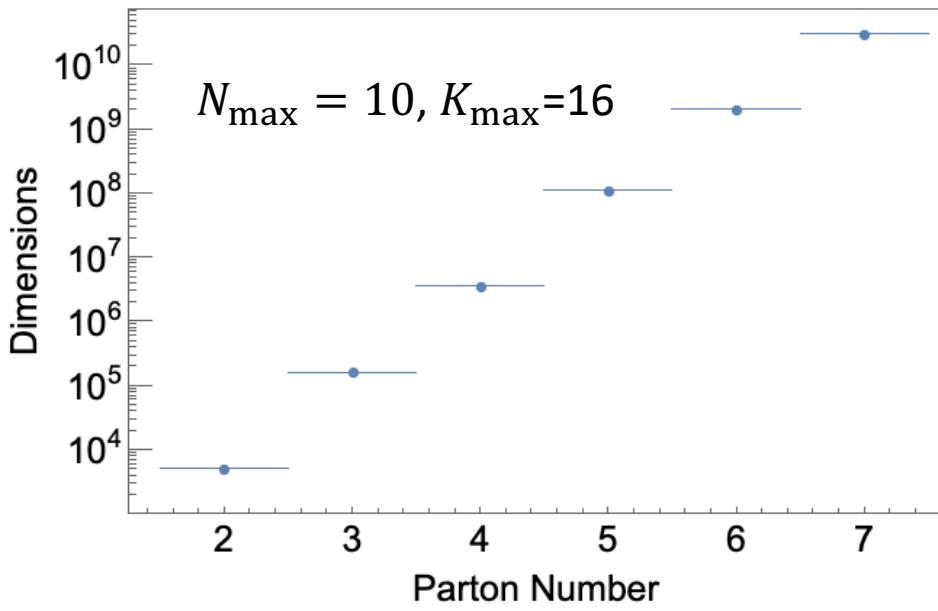

- BLFQ basis: expansion in Fock space

$$|\beta_{\text{meson}}\rangle = |q\bar{q}\rangle + |q\bar{q}g\rangle + |gg\rangle + |q\bar{q} q\bar{q}\rangle + |q\bar{q} gg\rangle + |q\bar{q} q\bar{q} g\rangle + |q\bar{q}q\bar{q}gg\rangle + \dots$$

$$|\beta_{\text{baryon}}\rangle = |qqq\rangle + |qqqg\rangle + |qqq q\bar{q}\rangle + |qqq gg\rangle + |qqq q\bar{q}g\rangle + |qqqq\bar{q}gg\rangle + \dots$$

$$|\beta_{\text{deuterium}}\rangle = |qqq qqq\rangle + |qqq qqq g\rangle + |qqq qqq q\bar{q}\rangle + |qqq qqq gg\rangle + \dots$$

- Dimension of basis states increases with number of Fock sectors
=> motivation for quantum computing

Baryons with one dynamical gluon

$$|P_{baryon}\rangle = \Psi_1 |qqq\rangle + \Psi_2 |qqqg\rangle$$

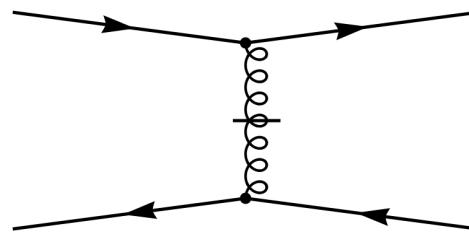

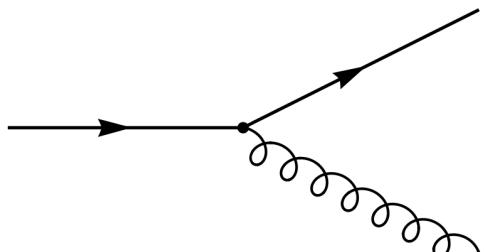

$$\mathbf{P}^- = \mathbf{H}_{K.E.} + \mathbf{H}_{trans} + \mathbf{H}_{longi} + \mathbf{H}_{Interact}$$

$$H_{K.E.} = \sum_i \frac{p_i^2 + m_q^2}{p_i^+}$$

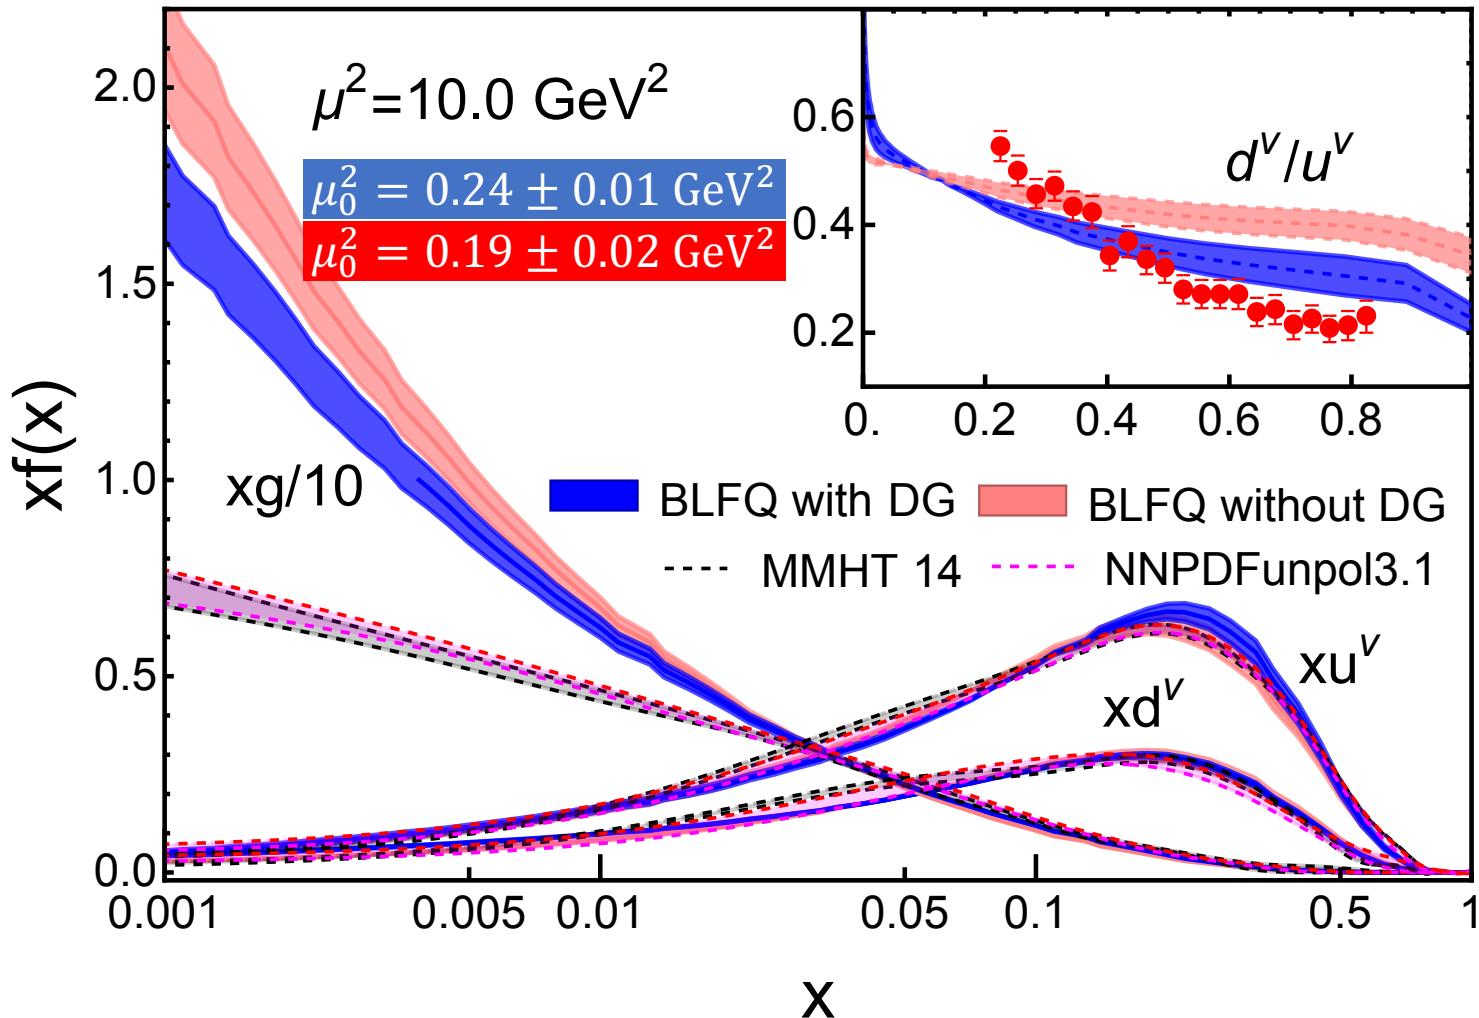

$$H_{trans} \sim \kappa_T^4 r^2 \quad \text{-- Brodsky, Teramond arXiv: 1203.4025}$$

$$H_{longi} \sim - \sum_{ij} \kappa_L^4 \partial_{x_i} (x_i x_j \partial_{x_j}) \quad \text{--- Y Li, X Zhao , P Maris , J Vary, PLB 758(2016)}$$

$$H_{Interact} = H_{Vertex} + H_{inst} = g \bar{\psi} \gamma^\mu T^a \psi A_\mu^a + \frac{g^2 C_F}{2} j^+ \frac{1}{(i\partial^+)^2} j^+$$

Unpolarized Parton Distribution Functions

The data are extracted from MARATHON data

Including the One Dynamical Gluon Fock Sector, the gluon distribution is closer to the global fit.

Nucleon Spin with BLFQ

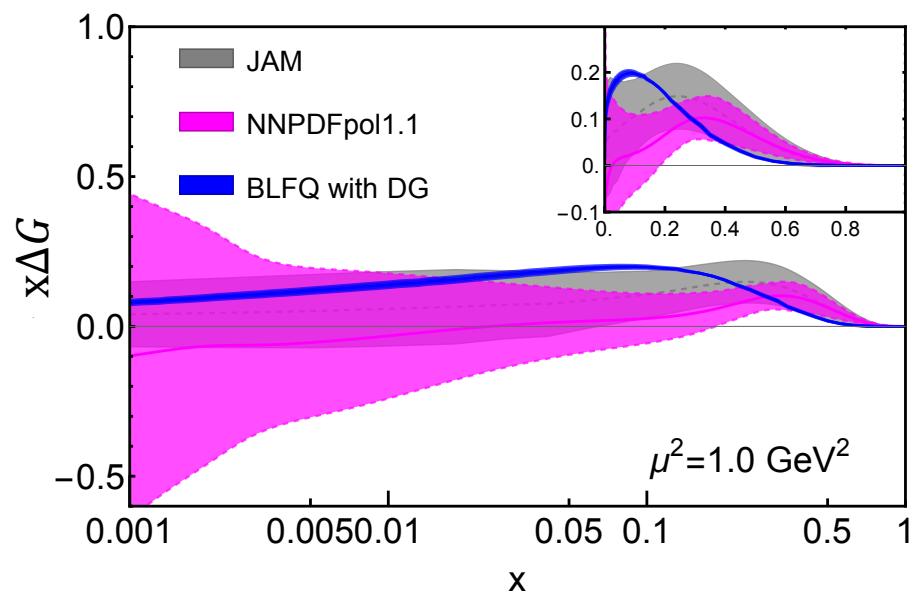

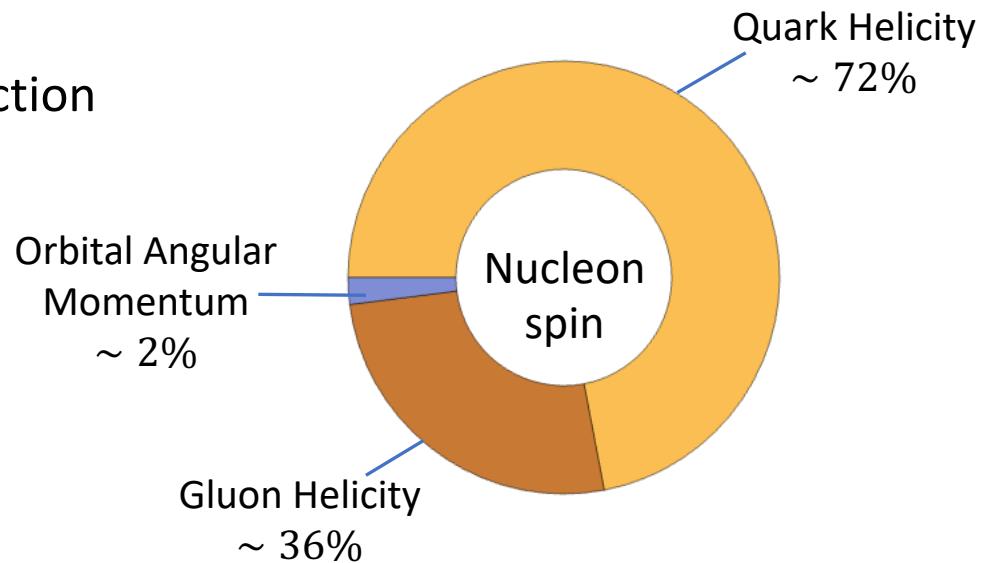

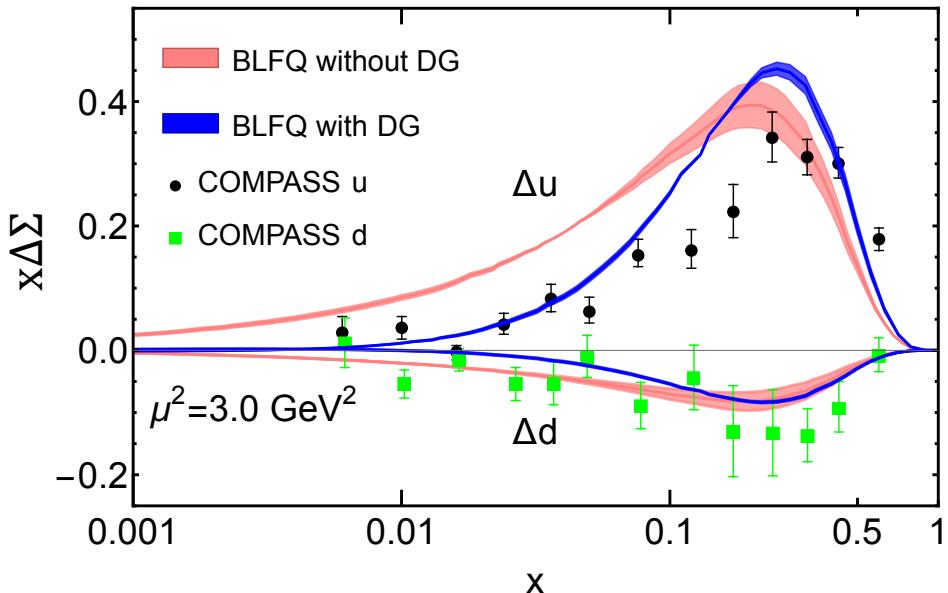

- Obtain observables from wave function

$$O \equiv \langle \beta', \Lambda' | \hat{O} | \beta, \Lambda \rangle$$

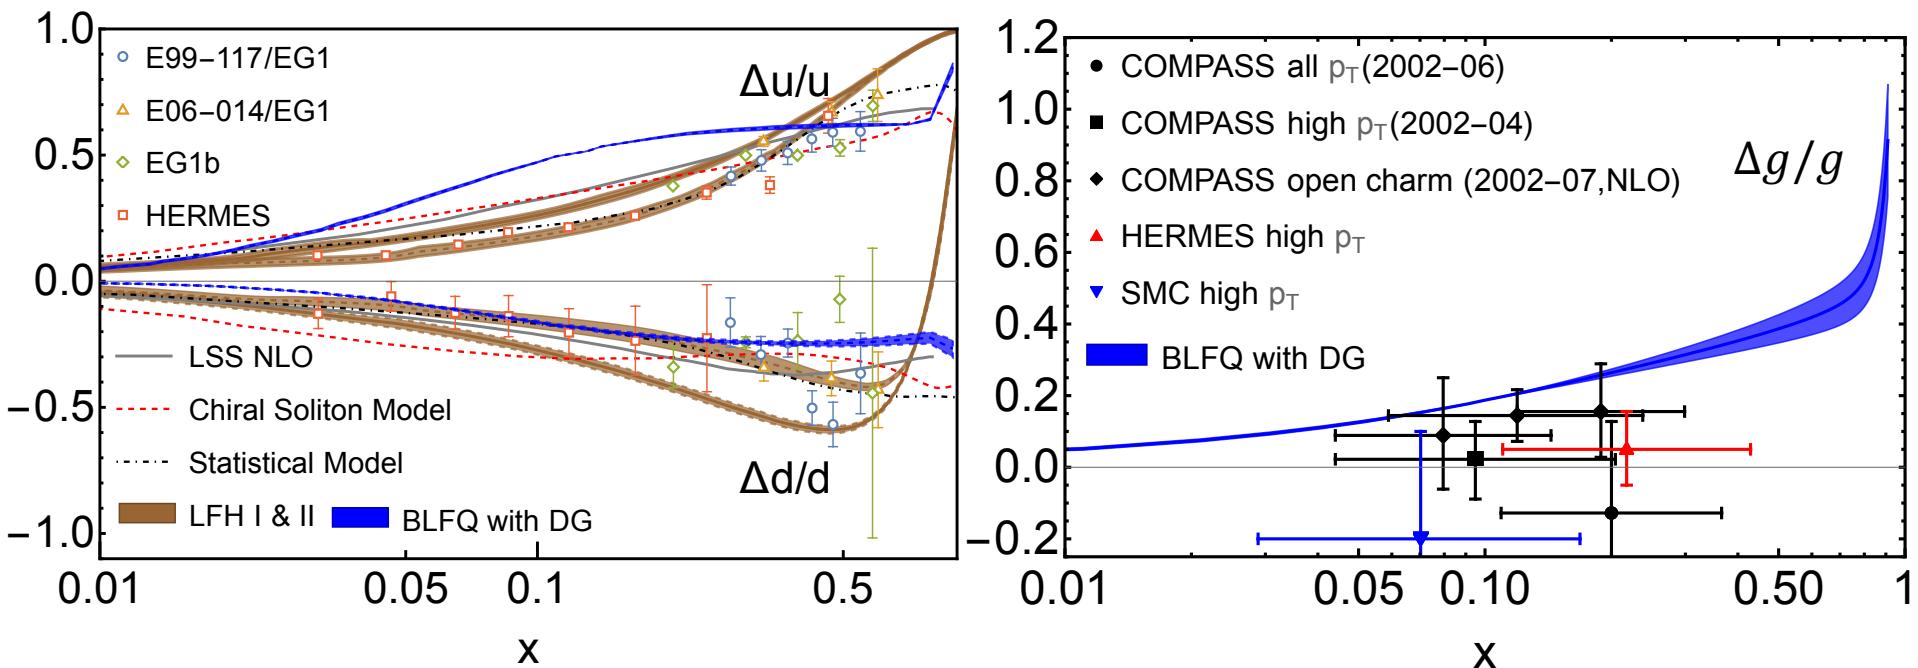

- Spin decomposition in BLFQ

$$\frac{1}{2} = \frac{1}{2} \Delta \Sigma + \Delta G + L_q + L_g$$

S. Xu, CM, X. Zhao, Y. Li, J. P. Vary, 2209.08584 [hep-ph].

Helicity Parton Distribution Functions

- $\Delta G = \int_0^1 dx \Delta g(x) = 0.131 \pm 0.003$, is sizeable to the proton spin.
- PHENIX Collaboration: $\Delta G^{[0.02, 0.3]} = 0.2 \pm 0.1$

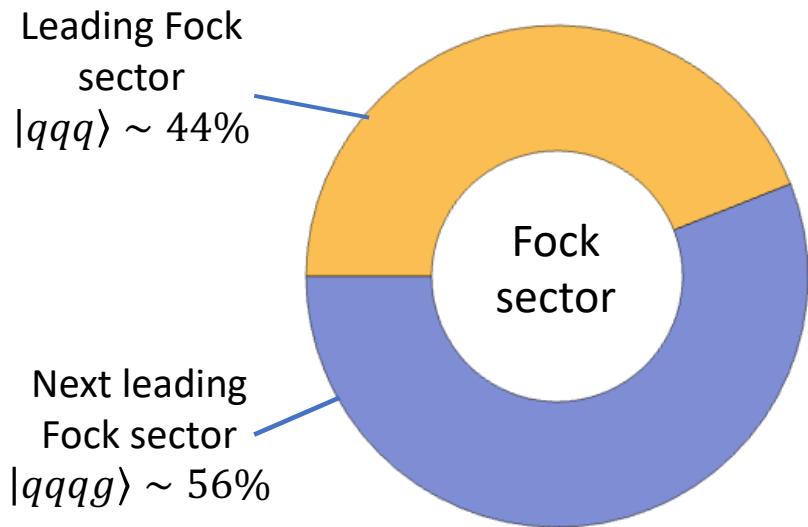

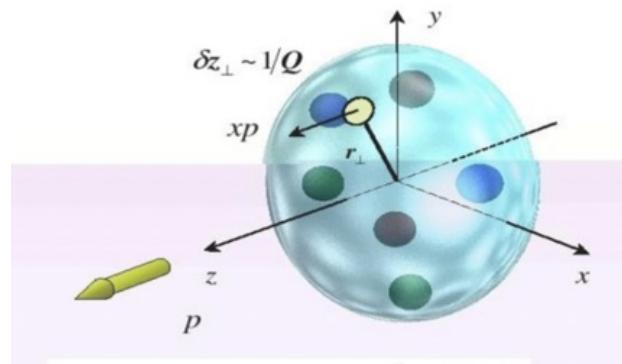

PRL 103 (2009) 012003

The sea quarks' contributions come from the DGLAP evolution

3-Dimension Structure of Nucleon

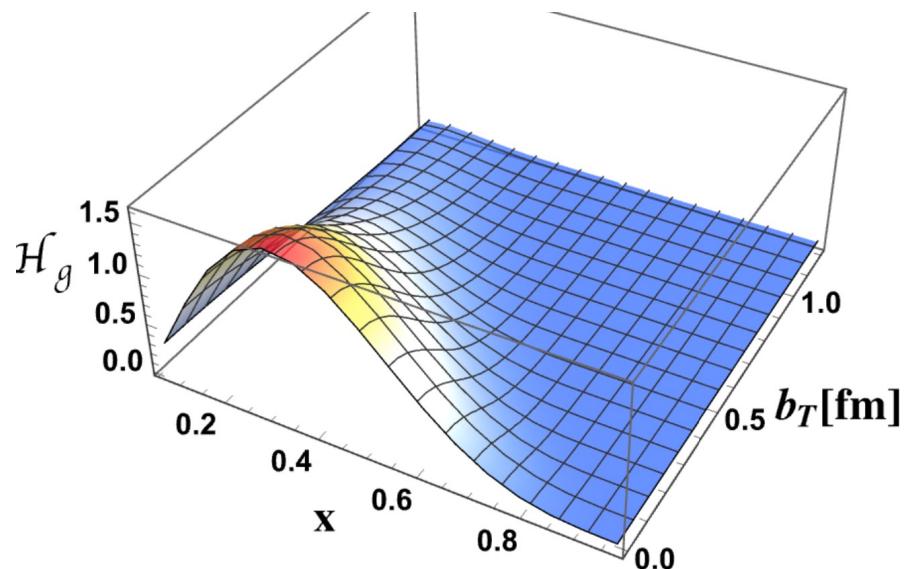

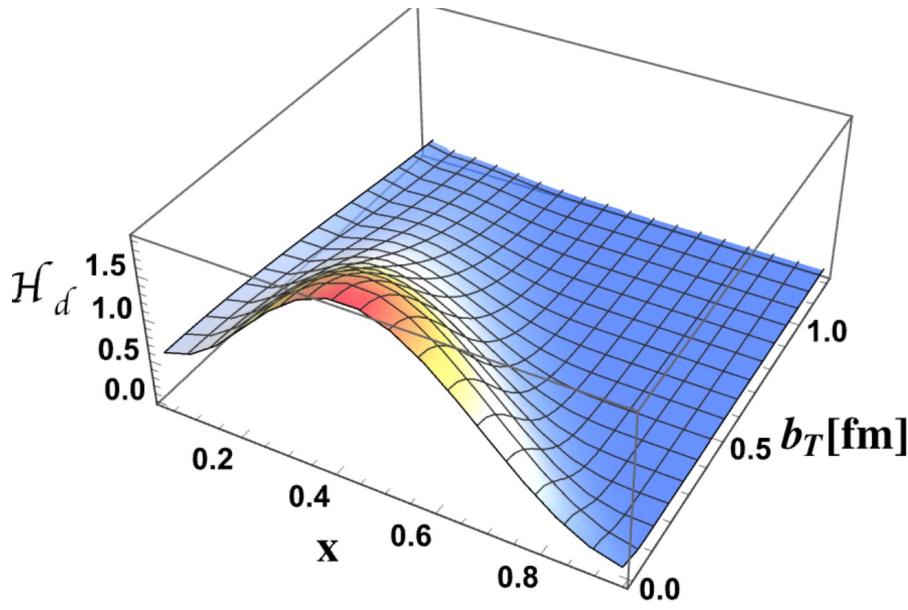

- Obtain observables from wave function

$$O \equiv \langle \beta | \hat{O} | \beta \rangle \quad |\beta_{\text{nucleon}}\rangle = |qqq\rangle + |qqqg\rangle$$

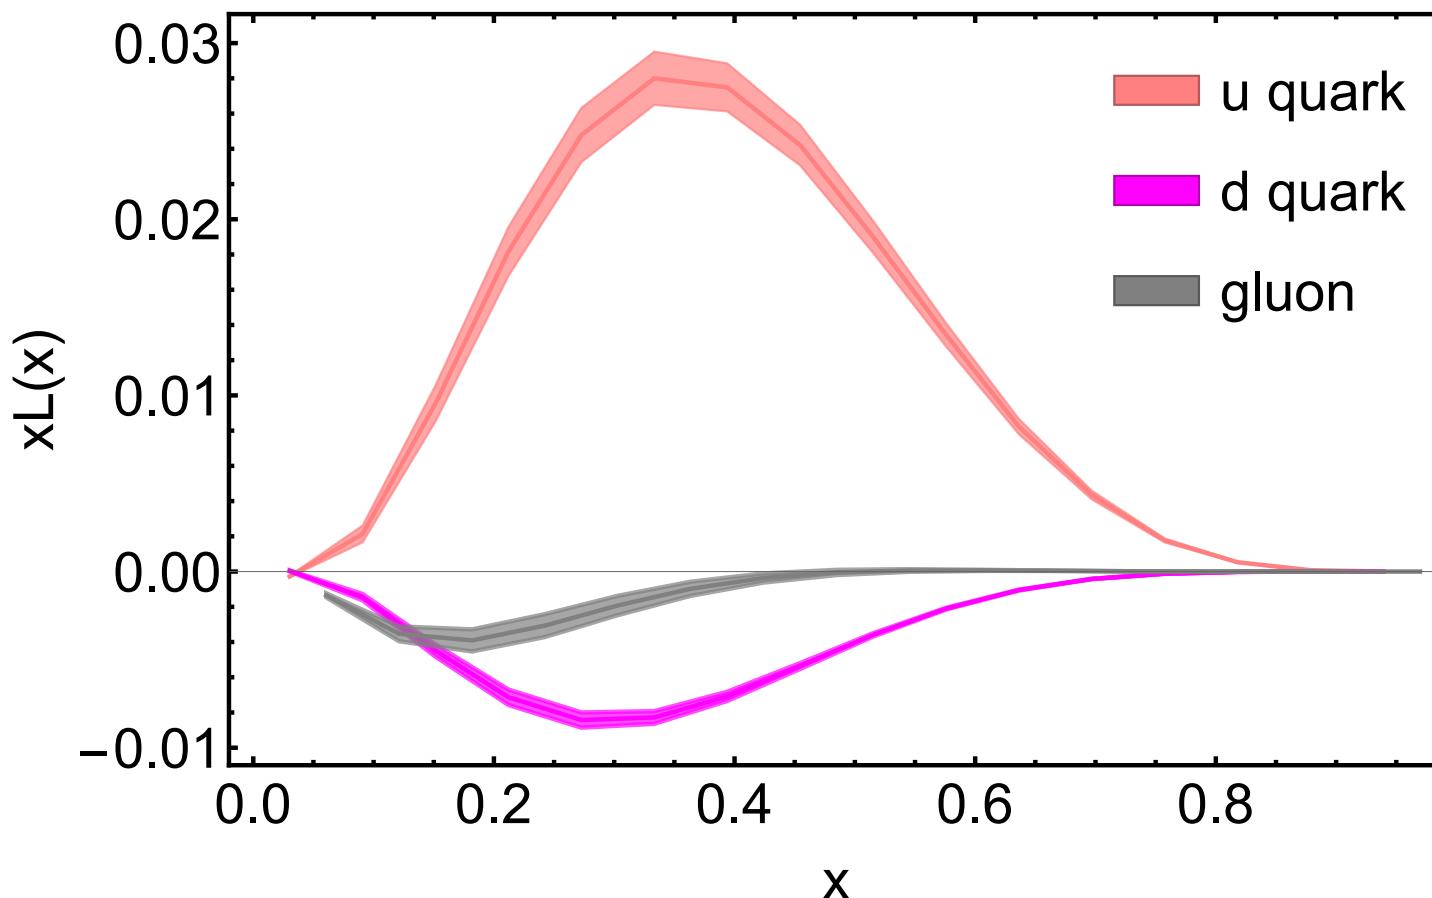

[arXiv:2209.08584 [hep-ph]]

[In preparation, Bolang Lin, Siqi Xu, C. Mondal *et.al*]

Orbital angular momentum distributions

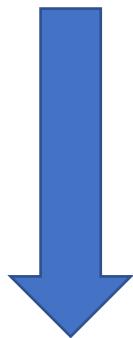

Canonical: $\ell_d = -0.0114 \pm 0.0004$ $\ell_u = 0.0327 \pm 0.0013$ $\ell_g = -0.0065 \pm 0.0005$

At the LC gauge : $\frac{1}{2}\Delta\Sigma = 0.359 \pm 0.002$ $\Delta G = 0.131 \pm 0.003$

Light-Front QCD Hamiltonian

$$|P_{baryon}\rangle = \Psi_1 |qqq\rangle + \Psi_2 |qqqg\rangle + \Psi_{31} |qqq u\bar{u}\rangle + \Psi_{32} |qqq d\bar{d}\rangle + \Psi_{33} |qqq s\bar{s}\rangle$$

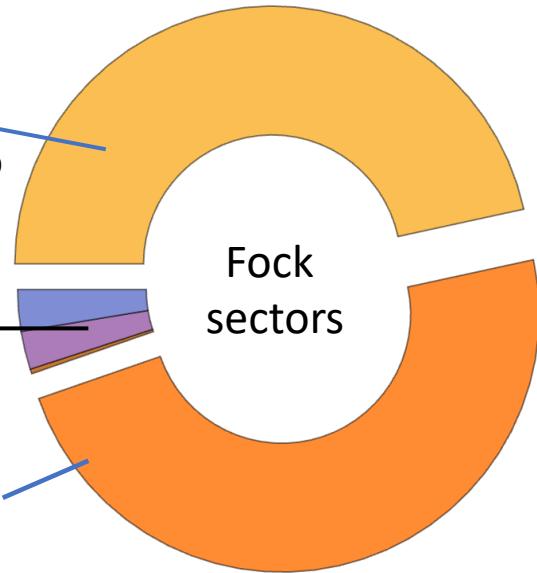

$$H_{Interact} = g \bar{\psi} \gamma^\mu T^a \psi A_\mu^a + \frac{g^2 C_F}{2} j^+ \frac{1}{(i\partial^+)^2} j^+$$

Next next leading Fock sectors
 $|qqq u\bar{u}\rangle \sim 2.6\%$
 $|qqq d\bar{d}\rangle \sim 2.4\%$
 $|qqq s\bar{s}\rangle \sim 0.4\%$

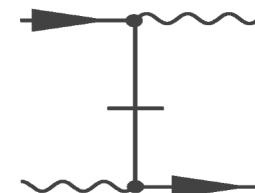

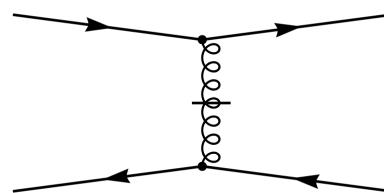

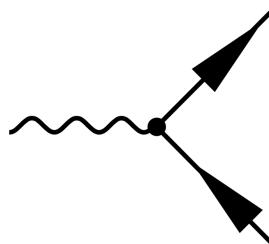

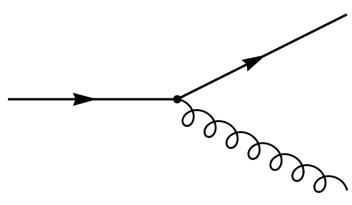

Leading Fock sector
 $|qqq\rangle \sim 46.5\%$

Next leading Fock sector
 $|qqqg\rangle \sim 48.1\%$

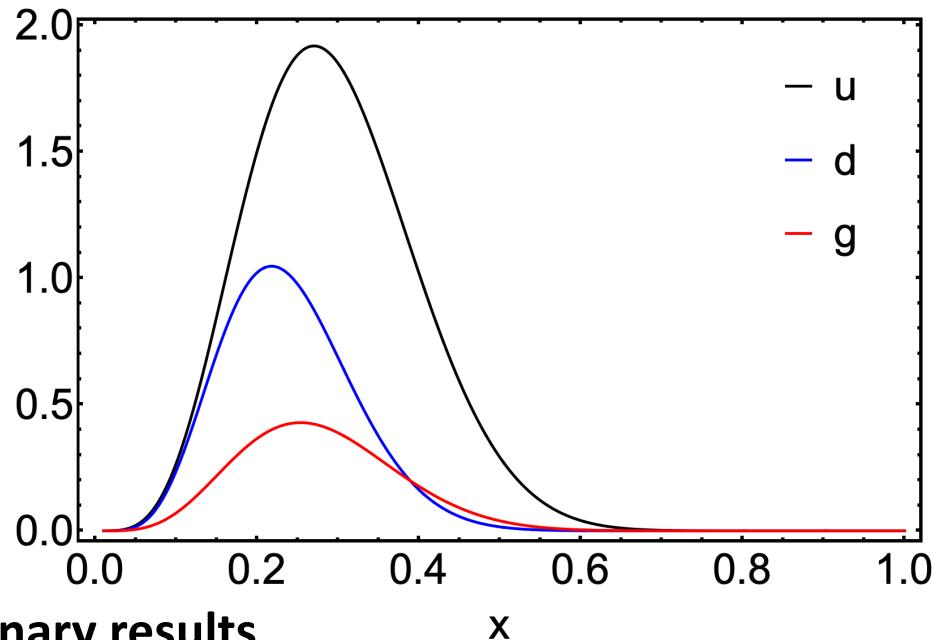

$$H_{Interact} = g \bar{\psi} \gamma^\mu T^a \psi A_\mu^a + \frac{g^2 C_F}{2} j^+ \frac{1}{(i\partial^+)^2} j^+ + \frac{g^2 C_F}{2} \bar{\psi} \gamma^\mu A_\mu \frac{\gamma^+}{i\partial^+} A_\nu \gamma^\nu \psi$$

Preliminary results
 Siqi Xu, et al, in prep

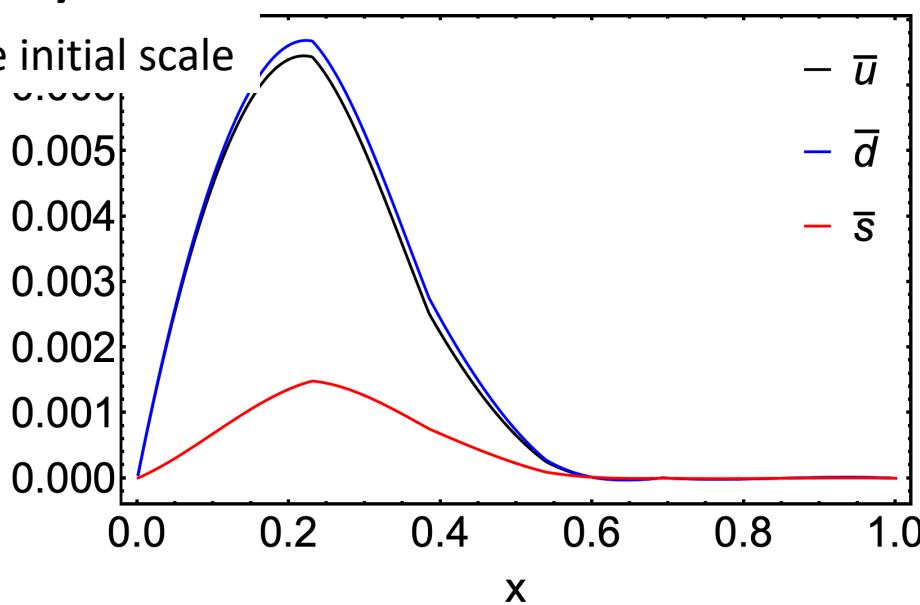

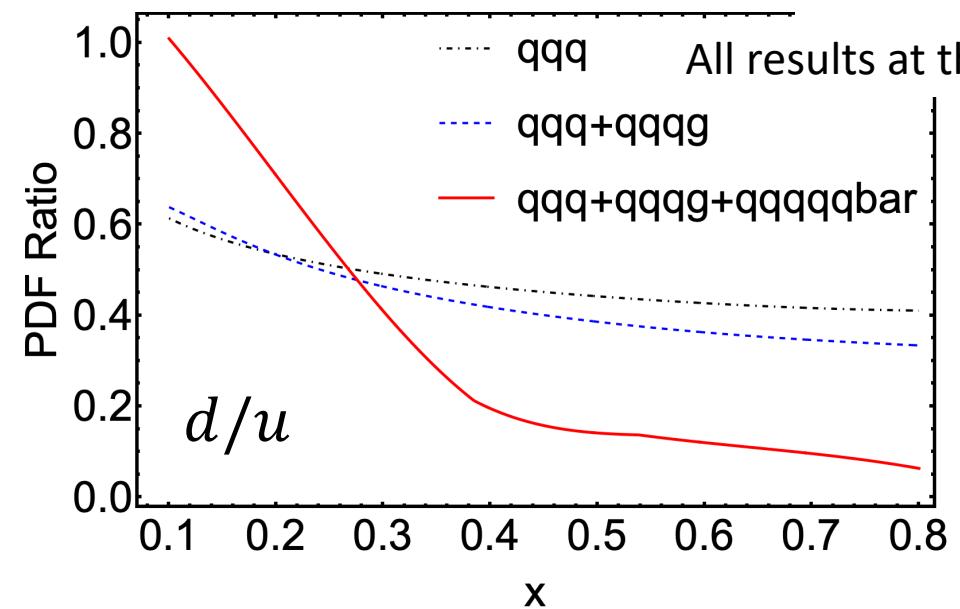

Parton Distribution Function

- Parton distribution functions with five Fock sectors
- One diagonalization, got the distribution of **valence quark, sea quark and gluon**
- PDF ratio $d/u = 0.04$ at $x \rightarrow 1$

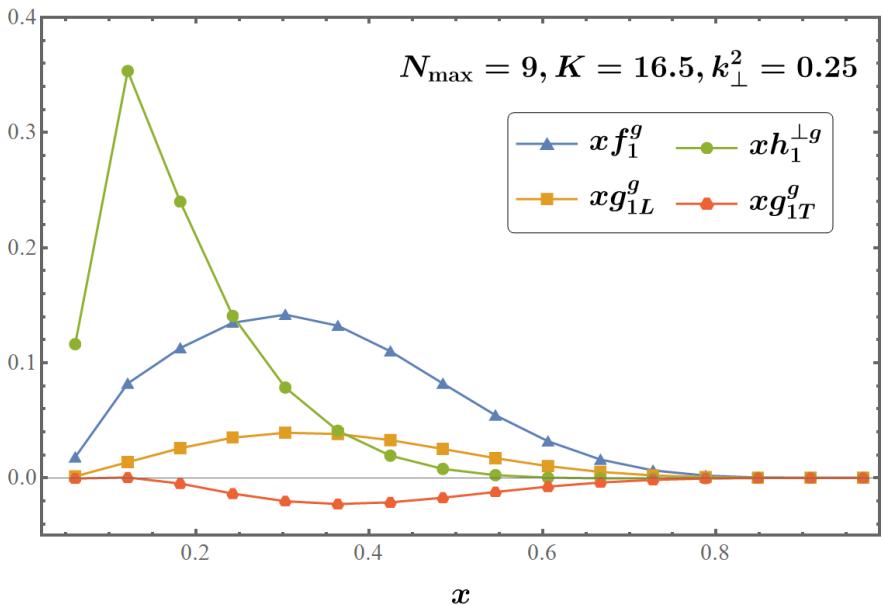

Preliminary results

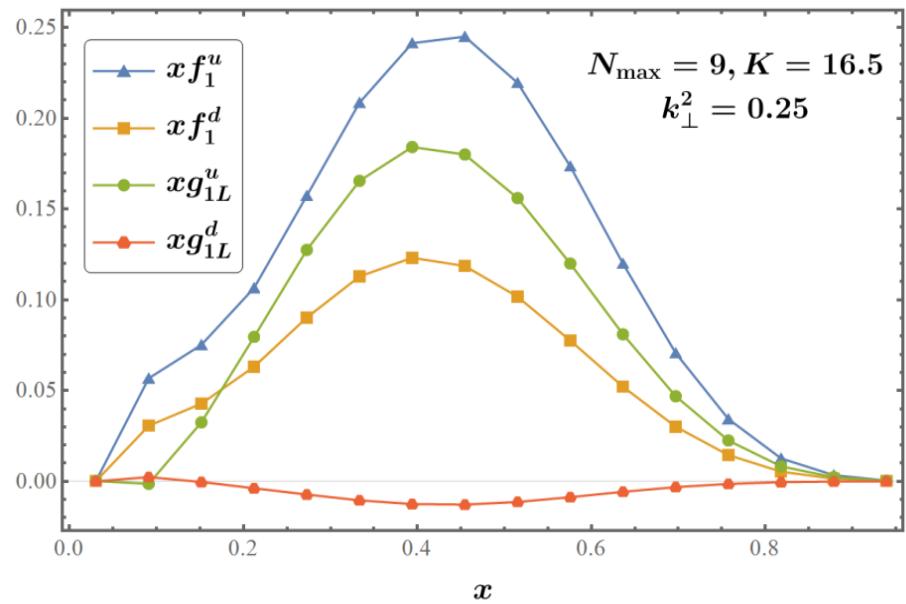

Now return to applications to baryons
solved in the $qqq + qqg$ sectors

Transverse-momentum dependent distribution

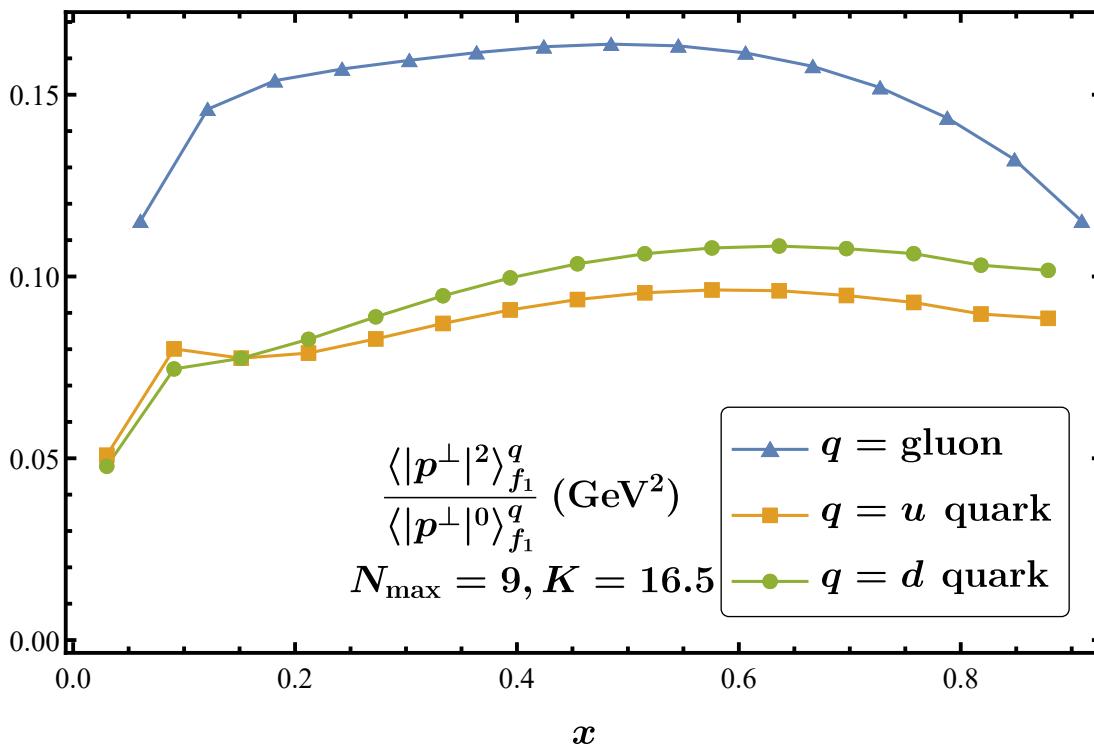

Gluon T-even TMD

Quark T-even TMD

- Within the Basis Light-front Quantization (BLFQ) we expand proton to $|qqq\rangle + |qqgg\rangle$ Fock sector, obtain the corresponding LFWFs and calculate T-even TMDs of gluon and quark

Average transverse momentum of quark and gluon

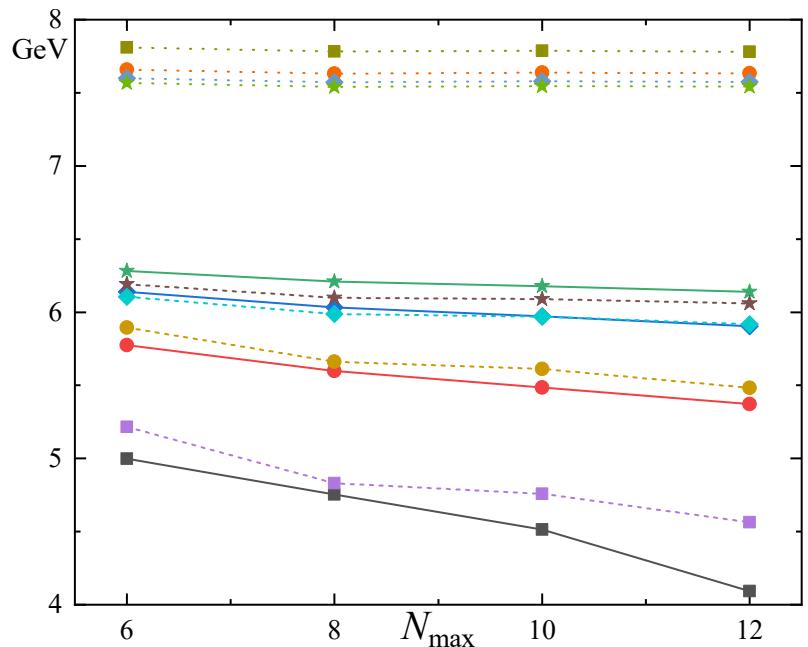

- After integrating over x , we further obtain
 $g: 0.156 \text{ (GeV)}^2$
 $u: 0.082 \text{ (GeV)}^2$
 $d: 0.083 \text{ (GeV)}^2$

- Define $\langle |p^\perp|^n \rangle_{f_1}^q = \int d^2 p^\perp |p^\perp|^n \times f_1^q$ then we know that $\frac{\langle |p^\perp|^2 \rangle_{f_1}^q}{\langle |p^\perp|^0 \rangle_{f_1}^q}$ would be the average transverse momentum of flavor q
- Average transverse momentum of d quark is slightly larger than that of u , the same as our $|qqq\rangle$ Fock sector conclusion.
- With $|qqqg\rangle$ Fock sector we now also know that transverse momentum of gluon is larger than that of quark

All-charm tetraquark using BLFQ

- New issues compared with mesons and baryons
 - Cluster decomposition principle for interactions
 - Identical particles issue
 - More than one color singlet
- Hamiltonian
 - Transverse confining potential like in AdS/QCD
 - Longitudinal confining potential (Głazek et al. PLB773, 172-178 (2017), different than BLFQ_0)
 - One-gluon-exchange spin-dependent potential (Wiecki et al.)
- Problem with negative M^2 solved by ad hoc modification of the Hamiltonian (which breaks cluster decomposition principle)

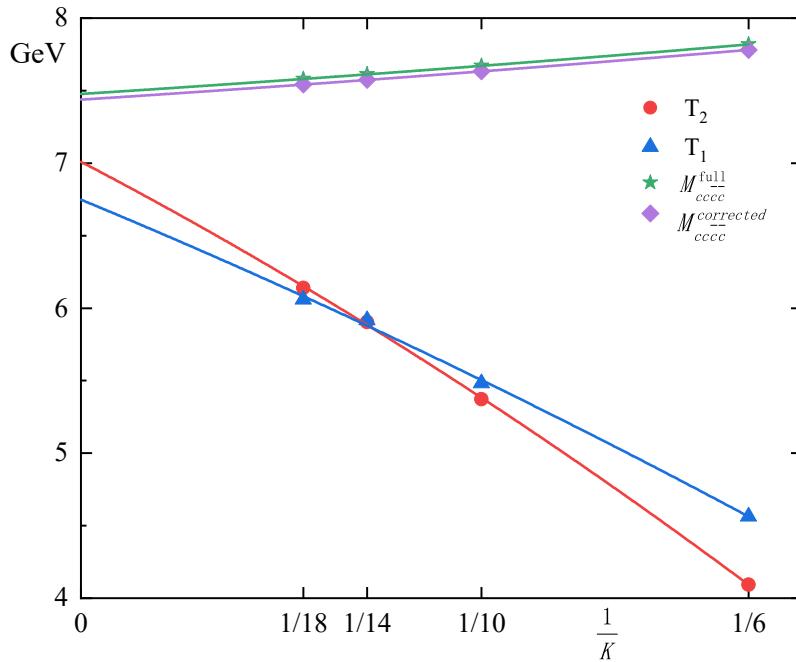

$K = 6 \blacksquare, 10 \bullet, 14 \blacklozenge, 18 \star$

Dotted – $M_{cc\bar{c}\bar{c}}^{\text{corrected}}$

Solid – T_2

Dashed – T_1

Extrapolations $K \rightarrow \infty$
 $N_{\max} = 12$

Forward quark jet-nucleus scattering in a light-front Hamiltonian approach

Time-dependent Basis Light-Front Quantization (tBLFQ)

- ❖ First-principles:

In the light-front Hamiltonian formalism, the state obeys the time-evolution equation, and the Hamiltonian is derived from the QCD Lagrangian

$$\frac{1}{2} P^-(x^+) |\psi(x^+) \rangle = i \frac{\partial}{\partial x^+} |\psi(x^+) \rangle$$

- ❖ Nonperturbative treatment:

The time evolution operator is divided into many small timesteps, each timestep is evaluated numerically and intermediate states are accessible,

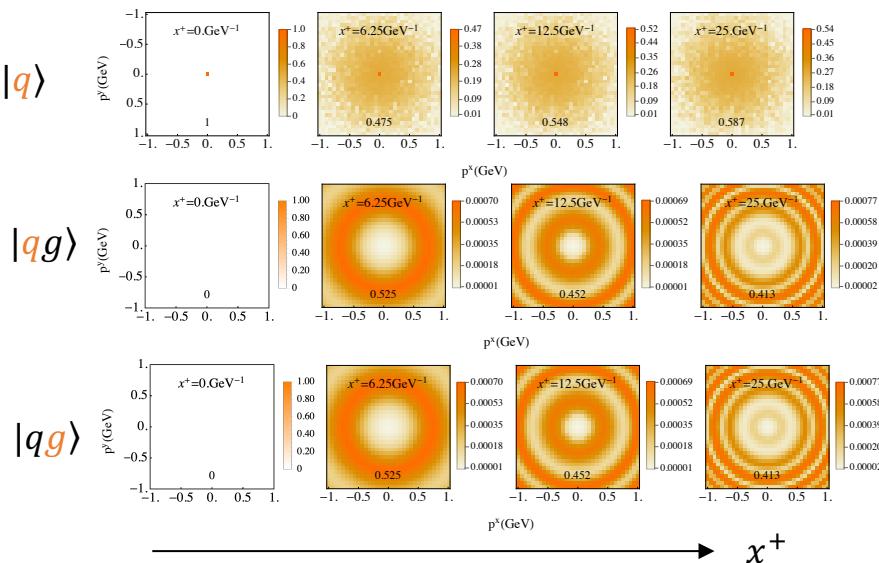

$$|\psi(x^+) \rangle = \mathcal{T}_+ \exp \left[-\frac{i}{2} \int_0^{x^+} dz^+ P^-(z^+) \right] |\psi(0) \rangle \\ = \lim_{n \rightarrow \infty} \prod_{k=1}^n \mathcal{T}_+ \exp \left[-\frac{i}{2} \int_{x_{k-1}^+}^{x_k^+} dz^+ P^-(z^+) \right] |\psi(0) \rangle$$

- ❖ Basis representation:

Optimal basis has the same symmetries of the system, and it is the key to numerical efficiency

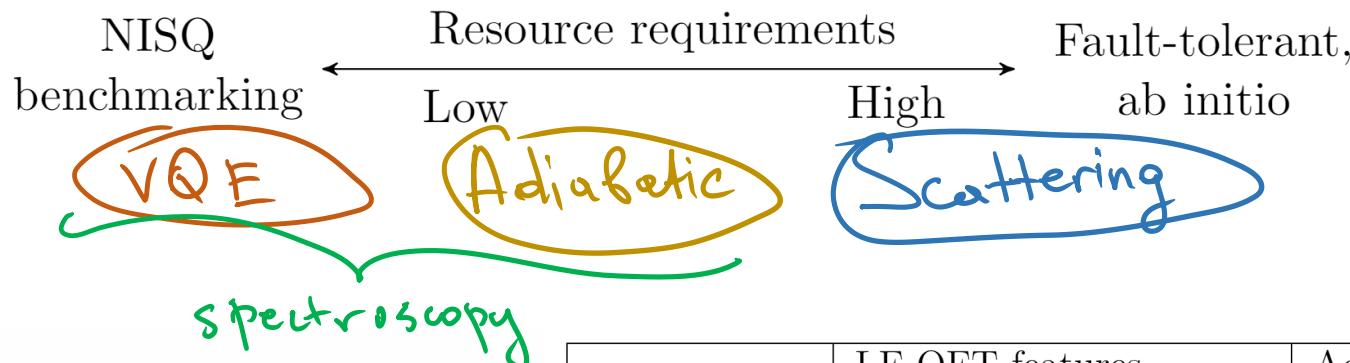

We consider scattering of a high-energy quark moving in the positive z direction, on a high-energy nucleus moving in the negative z direction.

Time evolution of a quark state in the $|q\rangle + |qg\rangle$ Fock space observed from the transverse momentum space

Quantum Simulation of QFT in the Front Form

2002.04016, 2105.10941, 2011.13443, 2009.07885

$$\mathfrak{Q}_{\text{Direct}} = O(K \log K)$$

$$\mathfrak{Q}_{\text{Compact}} = O(\sqrt{K} \log K)$$

Light front approach to hadrons on quantum computers

- Quantum computers: New tool to simulate many-body quantum system.
(quantum mechanical nature and high scalability)
- In the Noisy Intermediate-Scale Quantum (NISQ) era, the Variational Quantum Eigensolver (VQE) and Subspace-search VQE (SSVQE) [Nakanishi, 1810.09434] approaches are promising tools to solve nuclear physics problems.
- Advantages of light front Hamiltonian formalism are directly applicable
- We first formulate the problem on the light front and then map the Hamiltonian to qubits (quantum bits)

Formulating the problem on qubits

- We adopt the Hamiltonian used in a previous work: [Qian, 2005.13806]

$$H_{\text{eff}, \gamma_5} = \underbrace{\frac{\mathbf{k}_\perp^2 + m_q^2}{x} + \frac{\mathbf{k}_\perp^2 + m_{\bar{q}}^2}{1-x}}_{\text{LF kinetic energy}} + \underbrace{\kappa^4 x(1-x) \mathbf{r}_\perp^2 - \frac{\kappa^4}{(m_q + m_{\bar{q}})^2} \frac{\partial}{\partial x} (x(1-x) \frac{\partial}{\partial x})}_{\text{confinement}} + V_g + H_{\gamma_5}$$

[Vary, 0905.1411]

- Basis representation (BLFQ) is key to represent the Hamiltonian on qubits.
- Small-size Hamiltonians (4-by-4 and 16-by-16) are used. [Seeley, 1208.5986]
- Direct encoding and compact encoding are compared. [Kreshchuk, 2002.04016]

N_f	$\alpha_s(0)$	κ (MeV)	m_q (MeV)	N_{\max}	L_{\max}	Matrix dimension	
$H_{\text{eff}}^{(1,1)}$	3	0.89	560 ± 10	300 ± 10	1	1	4 by 4
$H_{\text{eff}}^{(4,1)}$					4	1	16 by 16

$$\begin{aligned} H_{\text{direct}}^{(1,1)} = & 2269462 \text{ IIII} - 284243 (\text{ZIII} + \text{IIIZ}) \\ & - 850488 (\text{IZII} + \text{IIIZ}) + 12714 (\text{XZXI} + \text{YZYI}) \\ & - 7883 (\text{IXZX} + \text{IYZY}), \end{aligned}$$

$$\begin{aligned} H_{\text{compact}}^{(1,1)} = & 1134731 \text{ II} - 566245 \text{ IZ} \\ & + 4831 \text{ XI} + 20598 \text{ XZ} \end{aligned}$$

Summary and Outlook

Basis Light Front Quantization approach to mesons and baryons
yields competitive descriptions and predictions

- ◆ Positronium test applications found successful
- ◆ Bound states and transitions of hadrons are described
- ◆ Time-dependent scattering applications are advancing
- ◆ Plan: continue to expand the Fock spaces (e.g. more gluons)
- ◆ Plan: continue to develop renormalization & counterterms
- ◆ Efficient utilization of supercomputing resources
- ◆ Well-positioned to exploit advances in quantum computing

Thank you for your attention
