

Update the Cross Section Measurement of  $e^+e^- \rightarrow \eta J/\psi$

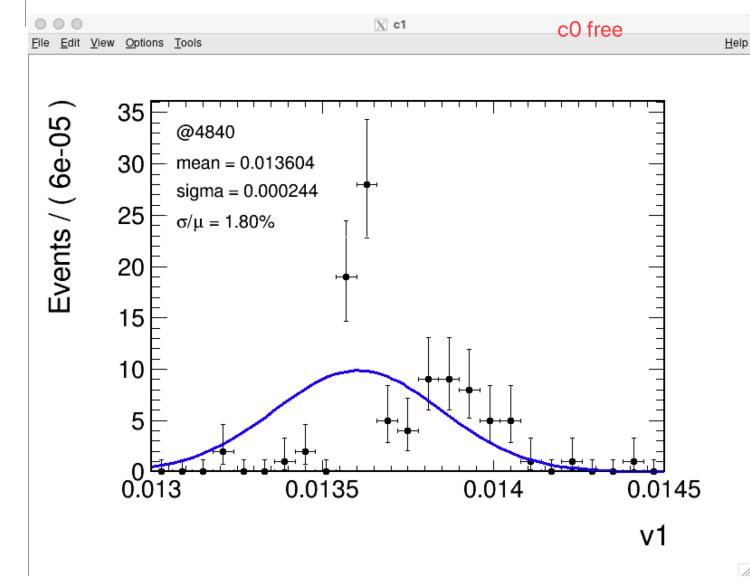

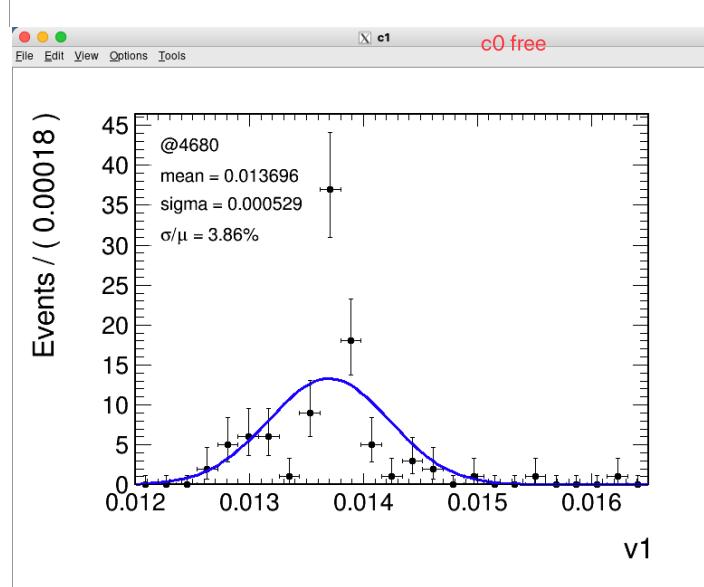

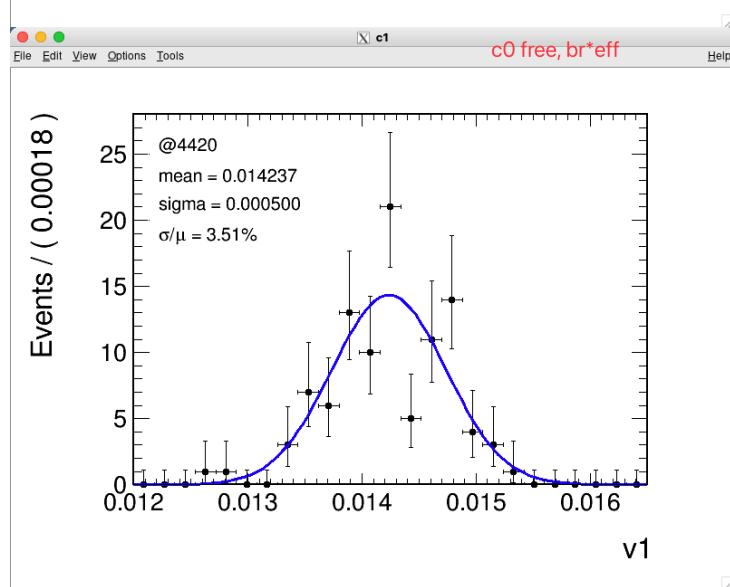

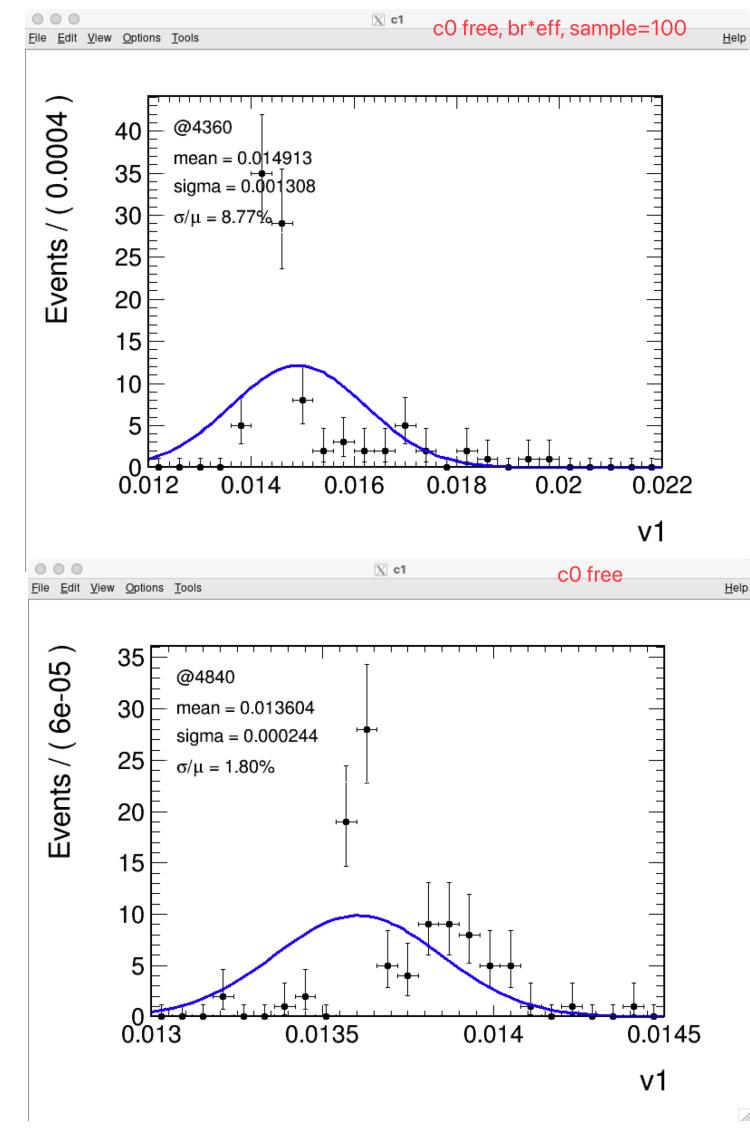

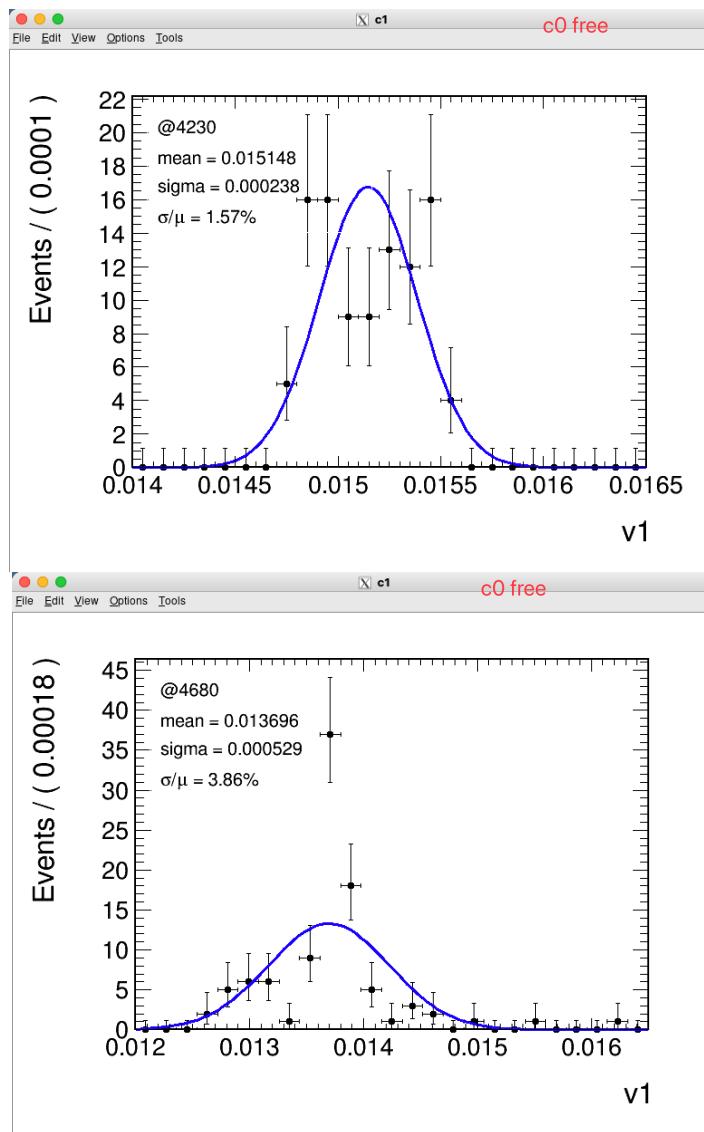

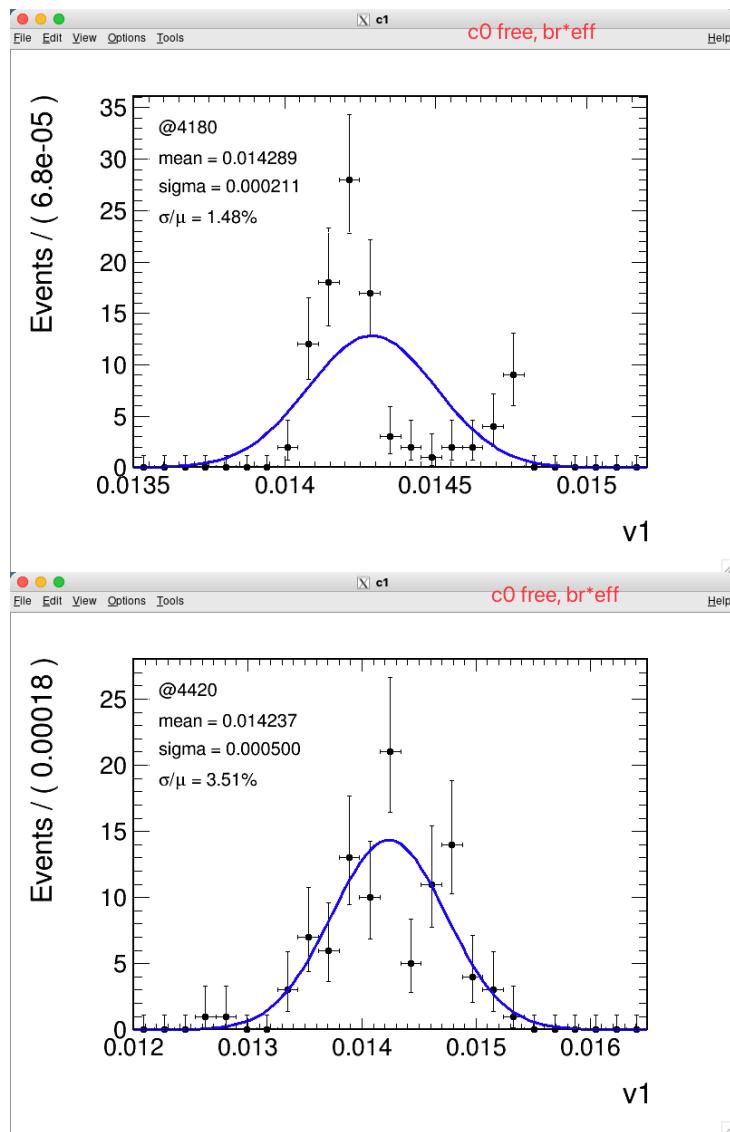

Systematic uncertainty of Radiative correction

## ISR correction

- An alternative way for the iteration (from idea of Lianjin Wu in PS meeting)
  - a flat lineshape to generate MC
  - calculate born cross section with ISR and eff from the MC
  - fit the new lineshape of the born cross section
  - event-by-event weight assign to events,  
$$W_i = \sigma(\sqrt{s_{\text{effective}}}) / \sigma(\sqrt{s_0})$$
  - $\epsilon^{\text{weight}} = \sum_i^{N_{\text{left}}} W_i / \sum_i^{N_{\text{gen}}} W_i$
  - $(1 + \delta)^{\text{weight}} = (1 + \delta)^{\text{initial}} \cdot \sum_i^{N_{\text{gen}}} W_i / N_{\text{gen}}$
  - iterate weights, so that of  $\epsilon^{\text{weight}}$  and  $(1 + \delta)^{\text{weight}}$ , to get new cross sections and lineshape

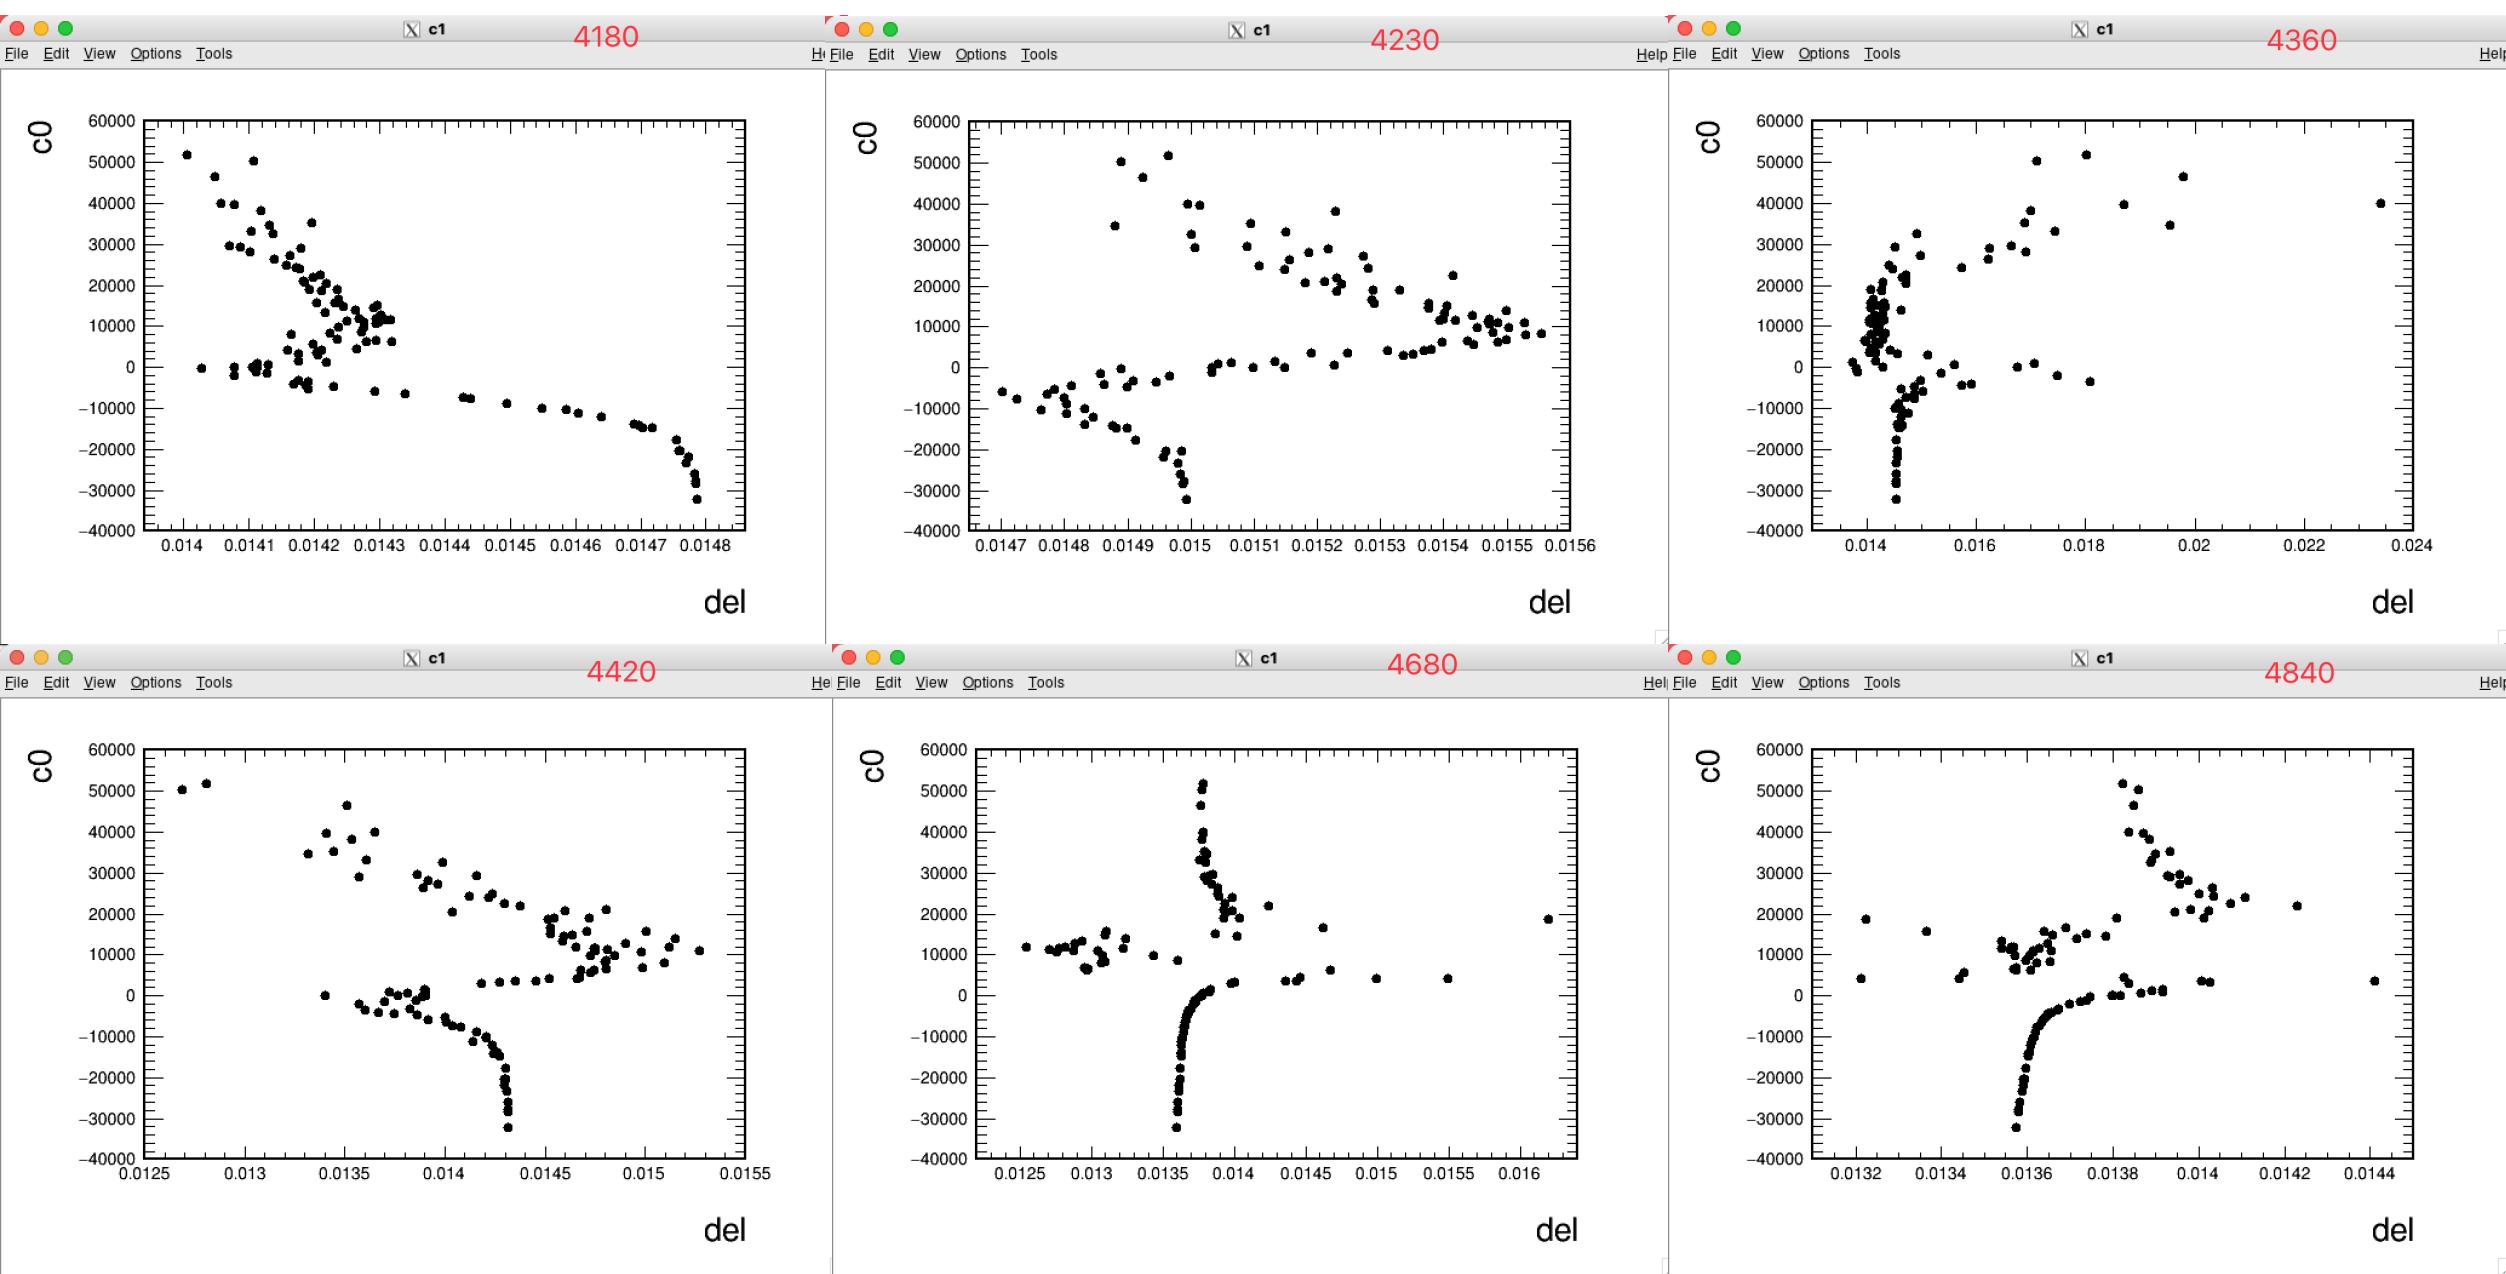

$$(1 + \delta^{ISR}) * \sum_i Br_i \epsilon_i$$

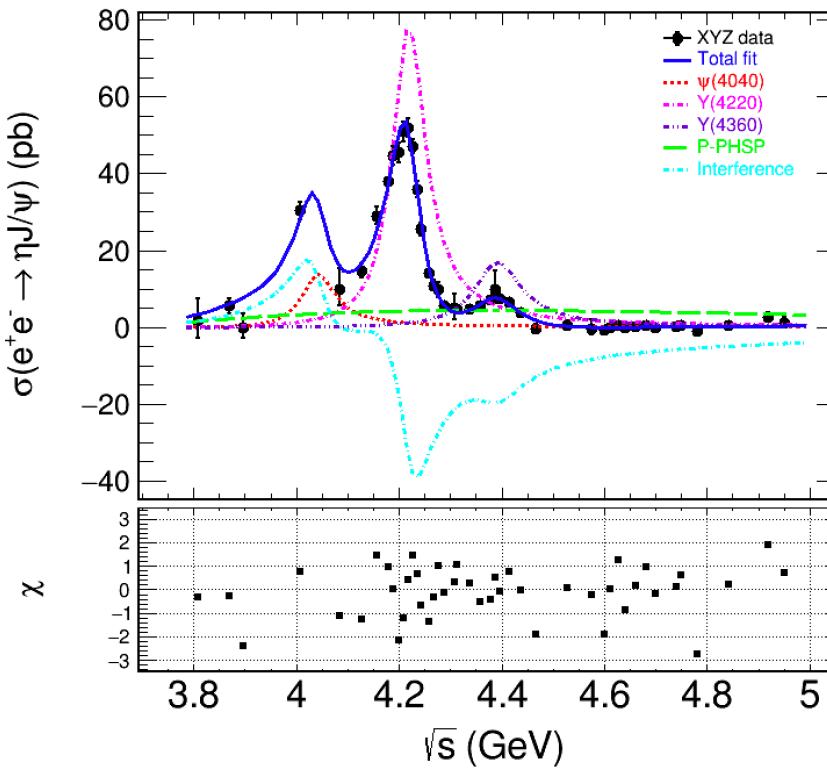

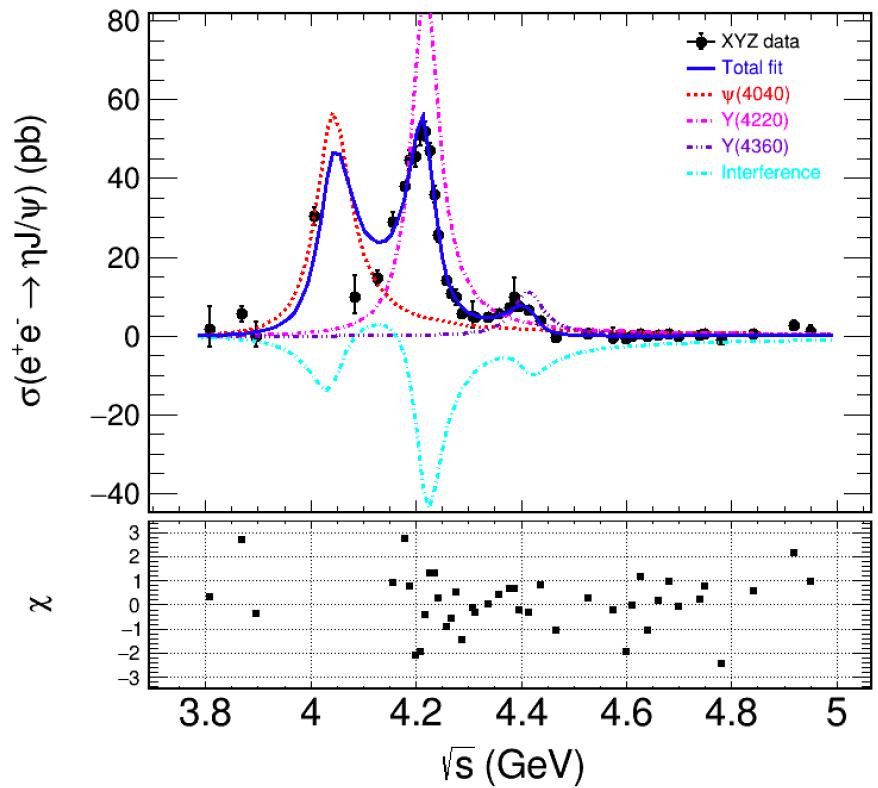

$$\sigma_{fit} = \left| C_0 \sqrt{\Psi(\sqrt{s})} + BW_1(\sqrt{s})e^{i\phi_1} + BW_2(\sqrt{s})e^{i\phi_2} + BW_3(\sqrt{s})e^{i\phi_3} \right|^2 \quad \Psi(\sqrt{s}) = \frac{q^3}{s^n}$$
