

Obtain Jpsi shape by pT smearing

Yuan Zhang
2023/10/17

MC

- MC:
 - LHC23d1k:
520259, 520294, 520471, 520472, 520473
- pp, 13.6 TeV - General Purpose MC anchored to LHC22f apass4

```
export O2DPG_ENABLE_TPC_DISTORTIONS=ON
SCfile=$PWD/distortions_5kG_lowIR.root # file needs to be downloaded
export O2DPG_TPC_DIGIT_EXTRA="--distortionType 2 --readSpaceCharge ${SCfile}"
```

In particular:

- same tag as data [O2-3346]
- ideal ITS/MFT alignment
- no TPC distortion maps (issue when simulating TPC distortion maps in MC (unexpected efficiency loss))
- PID in MC [O2-3346]

TPC Nsigma shifted since TuneOnData not yet implemented

TOF PID shifted because of a 70 ps shift in FT0 event time

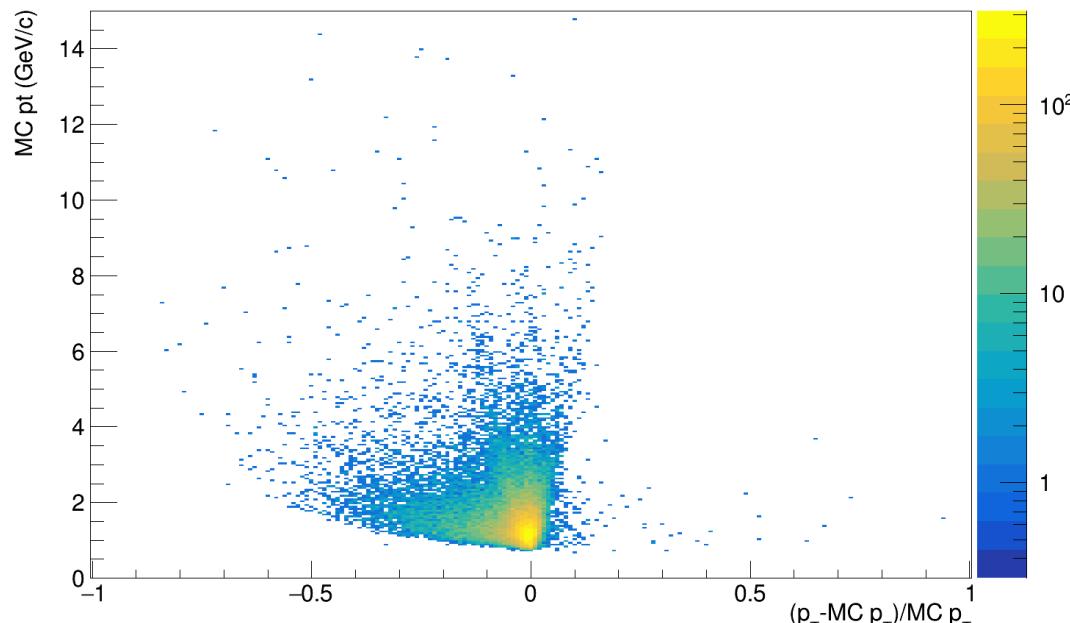

pT resolution

Track selection

- $pT > 1 \text{ GeV}/c$
- $|\eta| < 0.9$
- $\text{ITSncls} > 2$
- $0 < \text{ITSchiz} < 4$
- SPDany
- $\text{TPCncls} > 90$
- $0 < \text{TPCchi} < 4$
- $|\text{DCA}_{xy}| < 1$
- $|\text{DCA}_z| < 3$

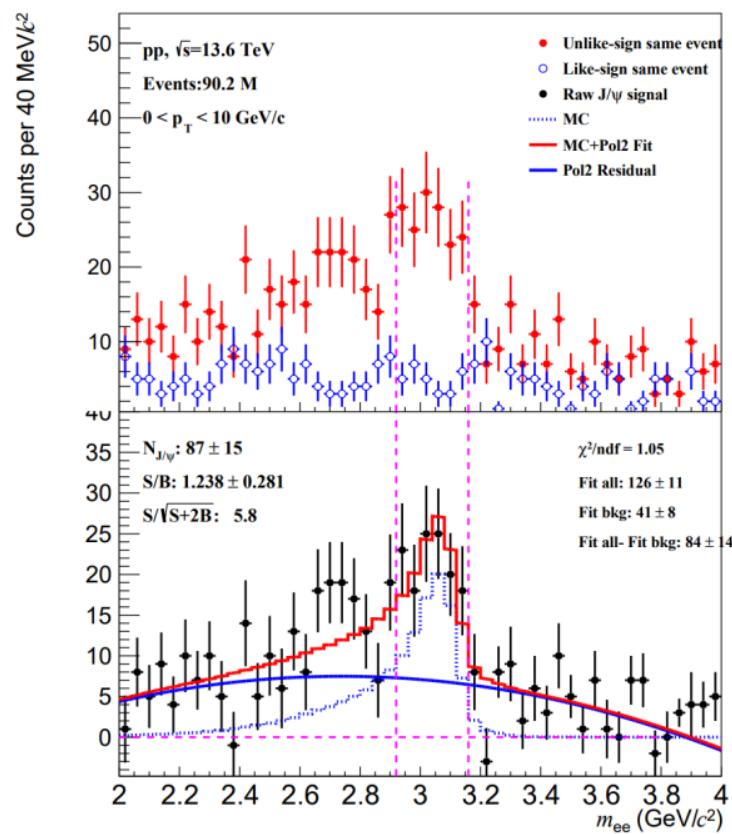

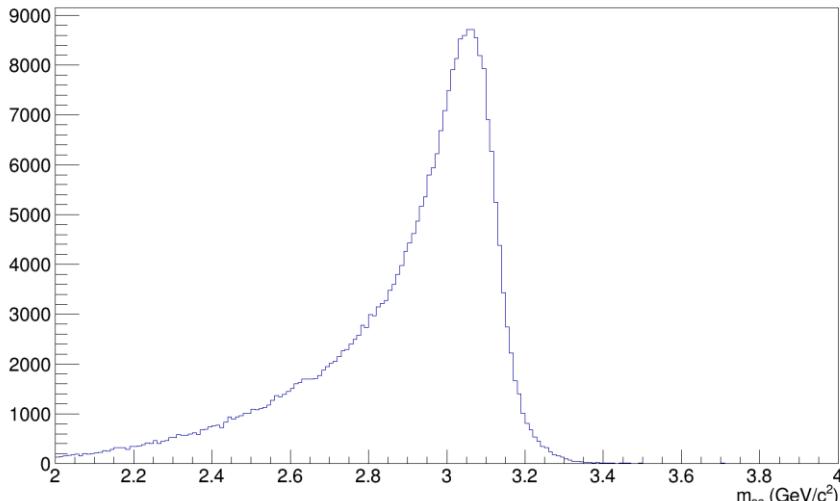

- $-3 < \text{TPC}n\sigma_e < 3$
- $\text{TPC}n\sigma_p > 3$
- $\text{TPC}n\sigma_\pi > 3$

➤ eFromAnything

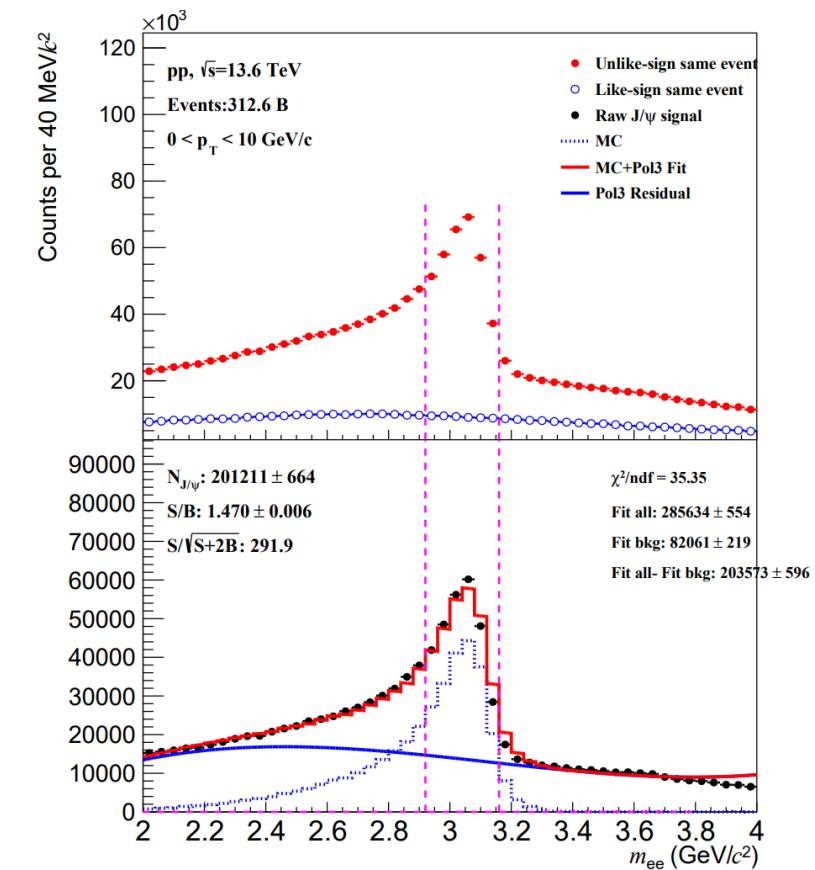

- Toy-MC is used to simulate Jpsi->ee decay.
- pT of electrons are smeared according to the pT vs MC pT distribution.
