Outline

Methodology: recoil mass

Methodology

- To improve the statistics and extract signal of pure charged channel, part reconstruction is applied with one π not reconstructed
- Take $2\pi^+2\pi^-$ as example:
 - If charged tracks satisfy $N_{\pi^+} = 2 \& \& N_{\pi^-} = 1$ or $N_{\pi^+} = 1 \& \& N_{\pi^-} = 2$, the missing π^\pm is reconstructed by recoil mass
 - If charged tracks satisfy $N_{\pi^+} = N_{\pi^-} = 2$, drop the π that has least momentum, and reconstructed by recoil mass
 - In the published work of $2K^+2K^-$, the combination of $3K$ that has least χ^2 of vertex fit is kept and the remain K is dropped
- Take $2\pi^+2\pi^-\pi^0$ as example:
 - Charged tracks must satisfy $N_{\pi^+} = N_{\pi^-} = 2$, no requirement on the neutral tracks, the π^0 is reconstructed by recoil mass
- Only cover
 - $2\pi^+2\pi^-$, $3\pi^+3\pi^-$
 - $2\pi^+2\pi^-\pi^0$, $3\pi^+3\pi^-\pi^0$

$2\pi^+ 2\pi^-$: momentum

- momentum of π tracks from the mc truth
